INTRODUCTION

Gabriel MacConaill was a partner in the bankruptcy group of the international law firm Sidley Austin LLP. Resident in the firm’s Los Angeles office, “he felt he was doing the work of three people,” and worked so hard on a bankruptcy filing that “he was in distress and . . . work[ed] himself to exhaustion”; however, he refused to go to the emergency room, because, as he told his wife: “‘You know, if we go, this is the end of my career.’” Then, on the morning of Sunday, October 14, 2018, he received an email to go to the office to “put something together”; he drove to his office, “taking his gun with him, and shot himself in the head in the sterile, concrete parking structure of his high-rise office building.” He was 42.

In an open letter written one month after his death, his wife wrote simply: “‘Big Law’ killed my husband.”

In July 2015, Peter, a partner at the Silicon Valley office of the law firm Wilson Sonsini Goodrich & Rosati LLP, “died a drug addict, felled by a systemic bacterial infection common to intravenous users.” He “lived in a state of heavy stress,” as he “obsessed about the competition, about his compensation, about the clients, their demands, and his fear of losing them. He loved the intellectual challenge of his work but hated the combative nature of the profession, because it

* Associate Professor of Law, Legal Practice, Georgetown University Law Center. Former associate and counsel, Boies Schiller Flexner LLP. The author is grateful to Steve Armstrong, Sonya Bonneau, Dan Bowling, Meghan Holtzman, David Jaffe, Larry Krieger, Patrick Krill, Todd Peterson, Danielle Reich, Jeffrey Shulman, and Tim Terrell for their insightful comments on this Article. The author additionally thanks Oliver Armas (Hogan Lovells), Sally King (Akin Gump Strauss Hauer & Feld LLP), and Wendy Cartland and Linda Myers (Kirkland & Ellis LLP) for discussing with me the innovative work their respective firms have begun to undertake to promote the well-being of their employees. Special thanks also to Sara Ellis and Jeremy McCabe for their excellent research assistance and to the Georgetown University Law Center for the grants and administrative support that made this Article possible.

4 Id. While MacConaill’s wife acknowledged that “Big Law” did not directly kill him, as he “had a deep, hereditary mental health disorder and lacked essential coping mechanisms[,]” id., she observed that “these influences, coupled with a high-pressure job and a culture where it’s shameful to ask for help, shameful to be vulnerable, and shameful not to be perfect, created a perfect storm.” Id.

5 Eilene Zimmerman, The Lawyer, The Addict, N.Y. TIMES (July 15, 2017). Ms. Zimmerman, Peter’s ex-wife, declined to use Peter’s surname in her article to “protect the privacy of [their] children and Peter’s extended family.” Id.
was at odds with his own nature.”6 His last phone call was for work: “vomiting, unable to sit up, slipping in and out of consciousness, [he] had managed, somehow, to dial into a conference call.”7

As he was being eulogized during his memorial service, “[q]uite a few” of his colleagues “were bent over their phones, reading and tapping out emails. Their friend and colleague was dead, and yet they couldn’t stop working long enough to listen to what was being said about him.”8

These two harrowing stories are hardly unique. Indeed, for more than thirty years, a significant number of studies, articles, and reports have demonstrated the prevalence of depression, anxiety, and addiction in the legal profession.9 Throughout this time, there have been just as many calls for the profession to make changes to promote, prioritize, and improve attorney well-being,10 particularly as many aspects of the current law firm model exacerbate mental health and addiction issues,11 as well as overall lawyer unhappiness and dissatisfaction.12

9 See, e.g., Connie J.A. Beck, et al., Lawyer Distress: Alcohol-Related Problems and Other Psychological Concerns Among a Sample of Practicing Lawyers, 10 J.L. & HEALTH 1 (1995); G. Andrew H. Benjamin et al., The Prevalence of Depression, Alcohol Abuse, and Cocaine Abuse Among United States Lawyers, 13 INT’L J. OF LAW & PSYCH. 233 (1990) [hereinafter Benjamin et al., Prevalence of Depression]; Patrick R. Krill et al., The Prevalence of Substance Use and Other Mental Health Concerns Among American Attorneys, 10 J. ADDICT. MED. 46 (2016); accord William W. Eaton et al., Occupations and the Prevalence of Major Depressive Disorder, 32 J. OCC. MED. 1079, 1085 tbl.3 (1990). Similar scholarship over this time period also demonstrates the widespread mental health and addiction issues among law students. See infra Part II.B.

10 See, e.g., Benjamin et al., The Prevalence of Depression, supra note 9, at 245 (“The national United States and the regional state Bar Associations should avoid the phenomenon of institutional denial and attempt to reach their members before symptoms lead to malpractice or unethical practice.”); accord, e.g., Rick B. Allan, Alcoholism, Drug Abuse and Lawyers: Are We Ready to Address the Denial?, 31 CREIGHTON L. REV. 265 (1997); Laura Rothstein, Law Students and Lawyers with Mental Health and Substance Abuse Problems: Protecting the Public and the Individual, 69 U. PITT. L. REV. 531 (2008).

11 See infra Part II.C.

12 There is a myriad of scholarship that refers to “happiness” (or, more particularly, a lack thereof) within the legal profession. See, e.g., NANCY LEVIT & DOUGLAS O. LINDER, THE HAPPY LAWYER: MAKING A GOOD LIFE IN THE LAW (2010); Lawrence S. Krieger & Kennon M. Sheldon, What Makes Lawyers Happy? A Data-Driven Prescription to Redefine Professional Success, 83 GEO. WASH. L. REV. 554 (2015) [hereinafter Krieger & Sheldon, What Makes Lawyers Happy?]; Patrick J. Schultz, On Being a Happy, Healthy, and Ethical Member of an Unhappy, Unhealthy, and Unethical Profession, 52 VAND. L. REV. 871 (1999); Martin E.P. Seligman et al., Why Lawyers are Unhappy, 23 CARDOZO L. REV. 33 (2001). This scholarship, to which this Article cites, examines “happiness” in the context of lawyer mental health, addiction, or distress or a deeper level of lawyer satisfaction (such as subjective well-being as that is understood under the tenets of Self-Determination Theory—see infra notes 119 - 123 and accompanying text) rather than mere notions of transient happiness or job “satisfaction.”

Empirical studies demonstrate the distinctions between the former and the latter. With respect to the latter, studies assessing levels of abstract “happiness” and job “satisfaction” suggest that “[a]s a general matter, lawyers are relatively satisfied with their job/careers.” See Jerome M. Organ, What Do We Know About the Satisfaction/Dissatisfaction of Lawyers? A Meta-Analysis of Research on Lawyer Satisfaction and Well-Being, 8 U. ST. THOMAS L.J. 225, 261-62 (2011); see also id. at 261 (concluding that, upon an analysis of studies from the prior twenty-five years, an average of 78.8% of lawyers describe themselves as “satisfied”). As one example, in a thirty-
Despite these calls for change, the pervasiveness of mental health and addiction issues among attorneys has persisted, if not increased.\textsuperscript{13} Recognizing that this pervasiveness “can no longer be ignored,”\textsuperscript{14} in a 2017 Report entitled \textit{The Path to Lawyer Well-Being}, the American Bar Association’s National Task Force on Lawyer Well-Being issued a “call to action” for the profession to “get serious about the substance use and mental health of ourselves and those around us.”\textsuperscript{15} Partially in response to the Report, the profession made some inroads in addressing these problems: some firms have taken proactive steps to improve their attorneys’ well-being,\textsuperscript{16} and as of April 2019, approximately 90 law firms signed a pledge to support the ABA’s campaign to address mental health and addiction issues in the profession—which the ABA hoped that “all legal employers” would sign by January 1, 2019.\textsuperscript{17}

Notwithstanding the recognized need and these calls for change, the majority of firms have “turned a blind eye to widespread health problems” that pervade the profession.\textsuperscript{18} This Article argues that this “blind eye” exists in large part because firms have not had a financial incentive to address the problem. Law firms have increasingly moved from being “central players in a noble profession to a collection of profit-maximizing enterprises,” and this pursuit of profits has come at the well-being of the lawyers who generate them.\textsuperscript{19} As firms’ short-term goal of maximizing annual profits has become their principal long-term goal, lawyer distress has risen along with partner profits. Put differently, the commodification of the legal profession is an “unambiguous contributor” to the pervasiveness of lawyer distress.\textsuperscript{20} Additionally, many law firms also are reticent to change in part because of the stigma surrounding mental health or addiction issues—all of which can affect the bottom line.\textsuperscript{21}

Since the moral- and humanitarian-based cases for firms to promote and prioritize attorney well-being in the literature largely have been ignored, this Article is the first to make the business case to do so. In particular, this Article argues that systemic changes designed to provide support and resources to firm attorneys will avoid costs associated with attorney mental health and addiction issues and, more importantly, create efficiencies that will increase their long-term financial stability and growth. Further, this Article argues that, given a confluence of societal, industrial, and generational factors, now is the time for firms to focus on the health and well-being of its attorneys.

Part I of this Article is an overview of the studies of the last three-plus decades demonstrating the prevalence of depression, anxiety, and other mental health concerns as well as substance abuse in the legal profession. It shows that lawyers have consistently suffered from these issues in much greater proportion than the general population. It also demonstrates that the profession has long understood the need to change the paradigm to support attorneys struggling with mental illness and addiction, but it has largely remained silent in the face of calls for such change.

Part II examines the personal and professional risk factors that negatively affect mental health and addiction as well as lawyer distress generally. In particular, it addresses whether and to what extent there exists a lawyer “personality” that is inherently predisposed to mental illness and addiction. Further, relying largely on Self-Determination Theory and related research, this Part explores how both law school and law practice can contribute to and exacerbate lawyer mental illness, addiction, and mental distress.

Part III sets out why law firms have turned a “blind eye” to attorney well-being. Appeals to law firms—made largely on moral and humanitarian grounds—to provide support and resources to their lawyers and to make changes systemic changes to their practice largely have not resulted in meaningful change, and this Part analyzes why firms have had little incentive—both financial and cultural—to change their model. Specifically, Part III first argues that the commodification of the profession and firms’ focus on maximizing profits have come at the expense of lawyer well-being, and that the profession’s skyrocketing profits have not created an incentive for firms to change their model for the sake of the well-being of its lawyers. Part III also argues that firms generally and lawyers in particular have been hesitant to address mental health and addiction issues because of both the stigma attached to them and the professional and personal barriers to seeking treatment and assistance.

Finally, Part IV makes the business case for law firms to promote and prioritize attorney well-being. This Part first analyzes the different direct and indirect costs that firms face in failing to address lawyer mental health and addiction issues, from a rise in malpractice claims and sanctions to a decline in productivity to costs associated with high lawyer attrition. This Part also argues that now is the time for the law firm paradigm to shift to one that prioritizes attorney well-being. Society and industry has begun to recognize the importance of individual and employee mental and physical health, and law firms are beginning to take preliminary steps as well. Specifically, in part because of the ABA’s “call to action” in its Path to Lawyer Well-Being Report, law firms have begun to take steps to address lawyer well-being. It is in firms’ financial interests to do more because promoting lawyer well-being will benefit them financially and create efficiencies in productivity, retention, and recruitment that will make firms more
profitable. This is especially true now because, among other things: (i) clients are increasingly demanding lawyer efficiency, including through leaner staffing and the alternative fee arrangements; and (ii) younger Millennials and members of Generation Z, who as a group both experience depression and anxiety in larger numbers than prior generations and prioritize their mental and physical health in a way unseen in their more senior counterparts, are entering or are about to enter the profession.

I. MENTAL ILLNESS AND ADDICTION IN THE LEGAL PROFESSION: AN EMPIRICAL OVERVIEW

The first major studies identifying attorney mental health and substance abuse problems were conducted thirty years ago.22 These studies showed “significant elevated levels of depression” and a high percentage of “problem drinkers” both among professions and the general population. In the three decades since, not much has changed.

In 1990, Andrew Benjamin, Elaine Darling, and Bruce Sales published an empirical study about lawyers in the State of Washington who suffered from depression, alcoholism, and cocaine abuse.23 This study followed a 1986 study by Benjamin, Sales, and others of Arizona law students that found that “law students and lawyers suffered from depression at a rate twice to four times what would be expected in the general population.”24

The 1990 study found “no statistical differences” between the levels of depression among Arizona law students and young lawyers and Washington attorneys.25 Specifically, the Washington study found that nineteen percent of lawyers “suffered from statistically significant elevated levels of depression,” with “most . . . experiencing suicidal ideation.”26 The study also found that eighteen percent of lawyers were “problem drinkers”—approximately twice the alcohol abuse or dependency rates for adults in the United States.27 Depression rates remained the same across lawyers’ length of practice, but the rate of problem drinkers increased.28

Also in 1990, researchers at Johns Hopkins University studied the rates of major

24 Id. at 234 (citing G. Andrew H. Benjamin et al., The Role of Legal Education in Producing Psychological Distress Among Law Students and Lawyers, 11 AM. BAR FOUND. RES. J. 225 (1986) [hereinafter Benjamin et al., Role of Legal Education]]; see also id. at 247 (finding that “17-40% of law students and alumni in [the] study suffered from depression, while 20-45% of the same subjects suffered from other elevated symptoms”). For a detailed discussion of this study, see infra notes 114 – 117 and accompanying text.
25 Benjamin et al., Prevalence of Depression, supra note 9, at 240.
26 Id. at 240-41.
27 Id. at 241 (citation omitted). For purposes of the study, “problem drinkers” are defined as those “likely [to be] abusive of or dependent on alcohol.” Id. at 237.
28 Id. Specifically, the rate of problem drinkers rose from approximately 18% of those who practiced between two and twenty years to 25% of those who practiced twenty years or more. Id. The study notes that this likely is because “[a]lcohol abuse and dependency is a chronic and progressive disease[, and] it can take years to become evident in some cases. As a result, those who have practiced longer appear to be more susceptible to developing problem drinking.” Id.
CAPITALIZING ON HEALTHY LAWYERS

depressive disorder \(^{29}\) among individuals across 104 professions.\(^{30}\) While between three to five percent of the adult population suffers from major depressive disorder, these researchers found that ten percent of lawyers do so.\(^{31}\) Moreover, when adjusted for sex, race, education, and current employment, lawyers have the highest odds ratio for major depressive disorder among the professions studied—at a rate 3.6 times the general population.\(^{32}\)

Five years later, Benjamin, Sales, and Connie Beck published results of a study returning to the data and subjects of Benjamin and Sales’s 1990 study.\(^{33}\) They further analyzed the earlier data by: (i) considering additional demographic variables and analyzing how they may correlate with levels of distress and alcohol use; (ii) analyzing all types of distress; and (iii) “using sequential canonical analysis,” determining “the degree of relationship of the predictor variables to the different categories of psychological distress, a global measure of psychological distress, and current lifetime alcohol-related problems . . . .”\(^{34}\)

Their in-depth analysis yielded findings that further supported Benjamin and Sales’s earlier studies as well as the Hopkins study. For instance, they concluded that 20% of female attorneys were above the clinical cutoff for anxiety and 16% above the clinical cutoff for depression;\(^{35}\) male attorneys were above the clinical cutoffs for these distresses at 28% and 20%, respectively.\(^{36}\) As they observe: “The percentage of lawyers scoring above the cutoff is alarming in that the expected percentage of people scoring above the benchmark is only 2.27%.”\(^{37}\) Further, these numbers do not change markedly over the course of an attorney’s career.\(^{38}\) Similarly, they report an “astounding number of lawyers [have] a high likelihood of developing alcohol-related problems,”\(^{39}\) with “[a]pproximately 70% of lawyers . . . likely to develop alcohol problems over their lifetime,” a figure that both is “consistent across all years,” and is more than

\(^{29}\) A person has “major depressive disorder” if: (a) they have five or more of the following symptoms over the same two-week period: (i) depressed mood; (ii) markedly diminished interest or pleasure in all, or almost all, activities most of the day; (iii) significant weight loss or weight gain; (iv) insomnia or hyperinsomnia; (v) psychomotor agitation or retardation; (vi) fatigue or loss of energy; (vii) feelings of worthlessness or excessive or inappropriate guilt nearly every day; (viii) diminished ability to think or concentrate, or indecisiveness, nearly every day; and (ix) recurrent thoughts of death or suicidal ideation; (b) their symptoms cause clinically significant distress or impairment in social, occupational, or other important areas of function; and (c) the symptoms are not attributable to effects of a substance or another medical or psychological condition. AM. PSYCH. ASS’N, DIAGNOSTIC AND STATISTICAL MANUAL OF MENTAL DISORDERS 160-61 (5th ed. 2013).

\(^{30}\) Eaton et al., supra note 9, at 1079.

\(^{31}\) Id. at 1081 & 1082 tbl.2.

\(^{32}\) Id. at 1085 tbl.3.

\(^{33}\) Beck et al., supra note 9.

\(^{34}\) Id. at 12.

\(^{35}\) Id. at 25 & 23 tbl.4. They also concluded that approximately 27% of female lawyers scored above the clinical cutoff for interpersonal sensitivity, 20% for social alienation and isolation, 15% for obsessive-compulsiveness, and 11% for hostility. Id.

\(^{36}\) Id. at 23 & tbl. 4. They also concluded that approximately 30% of male lawyers scored above the clinical cutoff for interpersonal insensitivity, 25% for social alienation and isolation, 20% for obsessive-compulsiveness, 14% for paranoid ideation, 7% for phobic anxiety, and 7% for hostility. Id.

\(^{37}\) Id. at 23.

\(^{39}\) Id. at 50.
five times greater than the 13.7% rate of lifetime prevalence of alcohol abuse or dependence for the general population.\textsuperscript{40} As a result of their study, they ultimately conclude that “psychological distress, in its many forms, is likely to affect newly practicing lawyers in a similar manner regardless of the state in which they practice,” and that “throughout their career span, a large percentage of lawyers are experiencing a variety of significant psychological distress symptoms well beyond that expected in a normal population.” \textsuperscript{41}

Other studies reached similarly striking conclusions. For instance, a 1987 study performed as part of a doctoral dissertation found that 32% of Florida attorneys “reported feeling depressed at least once a week,”\textsuperscript{42} and a 1988 study performed as part of another doctoral dissertation found that 79% of attorneys in Wisconsin “used alcohol regularly or sometimes to reduce stress.”\textsuperscript{43} Further, a 1991 report by the North Carolina Bar Association reported that over 24% of lawyers in that state suffer from depression, more than 25% display “anxiety symptoms,” and over 22% have been diagnosed with a “stress-related disease” such as ulcers, hypertension, or coronary artery disease.\textsuperscript{44} Shockingly, 11% of attorneys North Carolina surveyed “admitted they consider taking their lives once a month.”\textsuperscript{45}

Additionally, studies published during this time have found a correlation between substance abuse and attorney discipline, concluding that a disproportionate number of “major attorney disciplinary cases” were a result of attorney substance abuse. For instance, a report cited by the American Association of Law Schools in its 1993 \textit{Report on Problems of Substance Abuse in Law Schools} found that substance abuse was “involved” in 50% to 75% of such cases.\textsuperscript{46}

\textsuperscript{40} Id. at 51.
\textsuperscript{41} Id. at 57. They also conclude:

A picture emerges that does not bode well for harmonious family life. Lawyers have been slowly increasing the number of hours they work over time and taking only two weeks or less of annual vacation. The percentage of lawyers who report that they do not have enough time for themselves or their families has increased 33% from 1984 to 1990. Although this study’s findings indicate limited differences in feelings of stress between lawyers and the general population, another researcher has found that 32.5% of his sample of lawyers indicate that they use alcohol regularly as a coping mechanism to reduce stress. That a critical member of the family is working more, taking less time off, spending less time with the family, and potentially using alcohol to cope with high degrees of psychological distress suggests an impending major crisis for lawyers’ family life.

REV. 113, 114 (1992) \[hereinafter Benjamin et al., \textit{Comprehensive Lawyer Assistance Programs\]} (citing Allan McPeak, Lawyer Occupational Stress (1987) (unpublished Ph.D. dissertation, Florida State University)).

\textsuperscript{43} \textit{Id.} at 115 (citing Dennis W. Kozich, An Analysis of Stress Levels and Stress Management Choices of Attorneys in the State of Wisconsin (1988) (unpublished Ph.D. dissertation, University of Wisconsin-Madison)).

\textsuperscript{46} AM. ASS’N OF LAW SCHS., \textit{REPORT OF THE AALS SPECIAL COMMITTEE ON PROBLEMS OF SUBSTANCE ABUSE IN THE LAW SCHOOLS} ix (1993). Additionally, Benjamin and his colleagues noted in their 1990 report that the American Bar Association determined that “27 percent of the discipline cases in the United States involved alcohol abuse.” Benjamin et al., \textit{Prevalence of Depression, supra} note 9, at 244 (citation omitted). However, they opine that the actual figure “may actually be much higher, however, because not all state and county bar associations
An earlier survey conducted by the American Bar Association in New York and California found that “50-70 percent of all disciplinary cases involved alcoholism.”

In response to the pervasiveness of mental distress and addiction in the legal profession, many practitioners and scholars have called for changes to the profession. Among the largest changes was the development and expansion of Lawyer Assistance Programs. These programs generally provide support services to lawyers and legal professionals with mental health and substance abuse issues. Currently, all fifty states and the District of Columbia have some sort of Lawyers’ Assistance Program, most of which were established in the last thirty years.

Notwithstanding these calls for change, such change has been hard to come by. In the intervening years, articles and books have highlighted attorneys’ struggles with unhappiness and mental health and addiction issues, with one such article asking simply: “Why are lawyers killing themselves?”

A comprehensive 2016 study confirmed that not much, if anything, has changed in a quarter-century. This study, conducted by Patrick R. Krill, Ryan Johnson, and Linda Albert for the American Bar Association Commission on Lawyer Assistance Programs and the Hazelden report their disciplinary cases. In addition, under-reporting has occurred because state bar associations were unable to identify alcohol abusing lawyers who became part of the disciplinary process. Until very recently, very few bar associations considered the causes for the lawyer infractions.”

51 See generally id.

52 Id. at 1-2, A-3 through A-4. The ABA’s report only identifies forty-eight states and the District of Columbia in its survey, as programs from neither Nevada nor North Dakota replied. However, Nevada’s Lawyer Assistance Program was established in 2013, see Nevada Lawyers Assistance Program (NLAP), STATE BAR OF NEVADA, http://www.nvbar.org/member-services-3895/nlap/ (last visited Sept. 20, 2019), and North Dakota’s in 2004, see N.D. Sup. Ct. Admin. R. 49.

53 Although the first few LAPs were founded in the mid-1970s, thirty-two LAPs were founded since 1990. See ABA SURVEY OF LAWYER ASSISTANCE PROGRAMS, supra note 50, at 3 fig. 1; accord N.D. Sup. Ct. Admin. R. 49; Nevada Lawyers Assistance Program (NLAP), supra, note 52.

55 Rosa Flores & Rose Marie Acre, Why Are Lawyers Killing Themselves?, CNN.COM (Jan. 20, 2014), http://www.cnn.com/2014/01/19/us/lawyer-suicides/index.html. Among other things, this article noted that Kentucky had fifteen known lawyer suicides over a four-year period, South Carolina had six known lawyer suicides over an eighteen-month period in 2007-08, and Oklahoma had one known lawyer suicide per month in 2004. Id.
Betty Ford Foundation (the “Krill Study”), found numbers consistent with—and in some cases, more troubling than—the 1990 studies. The Krill Study surveyed nearly 13,000 practicing lawyers across the country and across varying demographics and types of legal practice. It found that “rates of problematic drinking” were “generally consistent” with those reported in Benjamin, Sales, and Beck’s 1990 study, with 20.6% to 36.4% of those surveyed qualifying as problem drinkers.

However, the Krill Study found “considerably higher rates of mental health distress” than those found in the earlier studies. In particular, it found 28.3% of attorneys surveyed suffering from some level of depression, 19.3% suffering from some level of anxiety, and 22.7% suffering from some level of stress. Further, 45.7% of surveyed lawyers reported concerns with depression at some point in their career, and 61.1% reported concerned with anxiety at some point in their career. An additional 11.5% of participants reported suicidal thoughts at some point during their career. Moreover, the study found that lawyers in their first ten years of practice as well as those working in private practice have the highest rates of both problem drinking and depression. In particular, the study found that 32% of lawyers under 30 are problem drinkers.

In light of, among other things, the Krill Study and a similar 2016 study of law students, this study, resulting from a survey of over 3,300 law students, found that “consumption of alcohol among law students appears to have become more prevalent than two decades ago,” and 35% of respondents have used illegal drugs or prescription drugs without a prescription in the prior twelve months, with 17% of law students experienced some level of depression, 37% reported some level of anxiety, and 6% reported suicidal ideation within the last twelve months.
in August 2016 the American Bar Association created a National Task Force on Lawyer Well-Being (the “Task Force”). The Task Force recognized that the prevalence of mental health and addiction issues in the profession “are incompatible with a sustainable legal profession,” and argued that “[t]o maintain confidence in the profession, to meet the need for innovation in how we deliver legal services, to increase access to justice, and to reduce the level of toxicity that has allowed mental health and substance use disorders to fester among our colleagues, we have to act now.”

To that end, The Task Force issued a report in August 2017, concluding that “lawyer well-being issues can no longer be ignored.” The report, entitled The Path to Lawyer Well-Being: Practical Recommendations for Positive Change, issued a “call to action” for the profession to “get serious about the substance use and mental health of ourselves and those around us.” It provided “three reasons to take action”: (i) “organizational effectiveness”; (ii) “ethical integrity”; and (iii) “humanitarian concerns.” First, the Report concludes (as this Article demonstrates) that “lawyer well-being contributes to organizational success,” as “lawyer health is an important form of human capital that can provide a competitive advantage.” Second, the Report concludes that “lawyer well-being influences ethics and professionalism,” with “40 to 70 percent of disciplinary proceedings and malpractice claims against lawyers involve substance use or depression, and often both.” Finally, the Report concludes that “from a humanitarian perspective, promoting well-being is the right thing to do.”

The Report goes on to make various recommendations for a series of “stakeholders”—judges, regulators, legal employers, law schools, bar associations, lawyers’ professional liability carriers, and lawyers assistance programs—to combat the “blind eye” that the legal profession has turned “to widespread health problems.”

stakeholders includes “buy-in and role modeling from the top-down” and taking steps to minimize the stigma of mental health and substance abuse disorders and to “facilitate . . . and encourage help-seeking behaviors.”82

By its own admission, the Report “makes a compelling case that the legal profession is at a crossroads,” as the “current course” of “widespread disregard for lawyer well-being and its effects[] is not sustainable.”83 It concludes that the profession has “ignored this state of affairs long enough,” and that “[a]s a profession, we have the capacity to face these challenges and create a better future for our lawyers” that is both “sustainable” and in pursuit of “the highest professional standards, business practices, and ethical ideals.”84

II. WHY THIS HAPPENS: PROFESSIONAL RISK FACTORS AFFECTING MENTAL HEALTH AND ADDICTION

There is no one answer for why lawyers disproportionately suffer from mental health and addiction problems compared to the general population. Yet the fact remains that they do. This Article does not minimize the existence of biological, chemical, and genetic conditions that predispose individuals to mental illness or addiction. These cannot, and should not, be discounted or overlooked by individuals with such predispositions. Nevertheless, what this Article does argue, and what is beyond dispute, is that lawyer distress is systemic—that there exists a strong correlation between the legal profession and lawyer distress that can no longer be ignored.85 Some of the potential systemic sources of attorney distress include: (i) the possible existence of an inherent “lawyer personality”; (ii) the law school experience; and (iii) several aspects of law practice.86

A. “LAWYER PERSONALITY”

It has long been assumed that the legal profession is composed of individuals who are inherently predisposed to being “pessimistic, unhappy, and more prone to destructive addictions than other occupational groups.”87 Indeed, accounts of the “depressing character of legal study”

82 Id.
83 Id. at 47.
84 Id.
85 Litowitz, supra note 54, at 19:
   Let us be very clear on the question of causality: the legal profession makes lawyers unhappy. We must reject any suggestion that lawyers are unhappy prior to their immersion in the legal system, that these unhappy people somehow self-select their own unhappiness by subconsciously placing themselves in a depressing profession. . . . We did not bring a cloud of depression to the profession; we discovered the cloud when we got here. In other words, the problems affecting young lawyers are predominately systemic, not personal
86 When discussing these as factors that affect attorney mental health and addiction issues, that is only to suggest, as noted above, the existence of correlations between these factors and such issues and not scientific conclusions of cause and effect. Rather, the studies and other works discussed in this Section establish correlations and apparent effects of these factors on attorney distress. Cf. Krieger & Sheldon, What Makes Lawyers Happy?, supra note 12, at 559 n.8 (explaining how their findings “provide substantial confidence in apparent causal relationships” despite the limitation of its study focusing on correlations, particularly because of “the large sample sizes and the consistency of [their] findings with similar findings in previous related studies”).
87 Margaret L. Kern & Daniel S. Bowling, III, Character Strengths and Academic Performance in Law
date back to at least the middle ages. Yet the question of whether lawyers as a group are inherently prone to struggles with mental illness and addiction is far from settled, and the most recent research suggests that the stereotypical lawyer “personality” does not exist.

Early studies support the view that there are inherent qualities in individuals who seek to become or who are successful lawyers. These studies conclude that “personality traits most common among lawyers are not those associated with happy people,” and that lawyers exhibit “several personality traits which tend to intensify lawyers’ stress levels,” such as low self-esteem, egotism, inflexibility, workaholism, cynicism, and aggression.

For instance, in an influential 2001 article, Martin Seligman, Paul Verkuil, and Terry Kang argue that lawyers are more successful when they have a “pessimistic ‘explanatory style,’” meaning they have a “tendency to interpret the causes of negative events in stable, global, and internal ways.” Also known as “prudence,” this perspective “requires caution, skepticism, and ‘reality-appreciation,’” and “enables a good lawyer to see snares and catastrophes that might conceivably occur in any given transaction.” This ability to anticipate problems and “issue-spot” is an essential quality for effective lawyering.

Although this kind of pessimism is a quality of a good lawyer, it also correlates to mental distress, as it is well-documented as a major factor for depression and distress. Lawyers who are pessimistic in practice often have that pessimism spill into their personal lives. For instance, lawyers who spend their working hours searching for, anticipating, and agonizing over problems tend to see the worst for themselves both inside and outside of the office. They may also have a more negative or pessimistic view of their work and their lives, and can focus on or even catastrophize problems in both. Accordingly, as Seligman, Verkuil, and Yang conclude,
“pessimism that might be adaptive in the profession also carries the risk of depression and anxiety in the lawyer’s life.”

Beyond this penchant for pessimism, Susan Daicoff has attempted to quantify the “lawyer personality.” In reviewing studies done on lawyer characteristics, she concluded that on the Myers-Briggs Type Indicator personality assessment measure, lawyers disproportionately represent the “Thinking” rather than the “Feeling” type when compared to the general population. She concluded further that, in contrast to most of the population, a majority of lawyers also are introverts rather than extroverts; intuitors rather than sensors; and judgers rather than perceivers. Based on her analysis, Daicoff contends that the “definable personality” is one “conceptually coalesced into two groups of five traits: (a) a drive to achieve . . . ; (b) dominance, aggression, competitiveness, and masculinity; (c) emphasis on rights and obligations over emotions, interpersonal harmony, and relationships; (d) materialistic, pragmatic values over altruistic goals; and (e) higher than normal psychological distress.”

However, one recent study has cast doubt into whether there are personality traits inherent within those in and choosing to enter the legal profession. A 2014 empirical study by Margaret Kern and Daniel Bowling challenges the notion that there is some inherent “lawyer personality.” They recognized that early studies support the vicious cycle of lawyers’ success coming from pessimism, which leads to unhappiness in life, but note that those studies have not been replicated. Their study revisited lawyer personalities by assessing twenty-four positive characteristics from the Values in Action Classification of Character Strengths (“VIA-IS”), as the selected traits “were seen as relatively universal, fulfilling to the individual, morally valued by individuals and societies, trait-like, distinctive, and measurable.” The study measured the

98 Seligman et al., supra note 12, at 41.
100 See id. at 32-36. Thinkers “prefer ‘logical analysis, principles and impersonal reasoning and cost/benefit analyses’ and are ‘more tolerant of conflict and criticism,’” while Feelers “prefer ‘harmonizing, building relationships, pleasing people, making decisions on the basis of [their own] . . . personal likes and dislikes, and being attentive to the personal needs of others’ and like to avoid conflict and criticism.” Id. at 33.
101 Id. at 32-36; see also id. at 34 tbl. 2.1.
102 Id. at 32-33. Introverts are those who “focus on their inner world and [who] often feel drained if they spend too much time with other people,” whereas extroverts are those who “focus on the outer world and feel energized by contacts with other people.” Id.
103 Id. at 33. Intuitors are those who “would rather think about the big picture, abstract ideas, and global themes, learn new things, and solve complex problems,” whereas sensors are those who “attend to concrete, real world things and enjoy working with real facts and details.” Id.
104 Id. at 32-36; see also id. at 34 tbl. 2.1. Judgers are those who “prefer structure, schedules, closure on decisions, planning, follow through, and a ‘cut-to-the-chase’ approach,” whereas perceivers are those who “prefer a ‘go with the flow and see what develops’ approach.” Id.
105 Id. at 41 & exh. 2.1.
107 Id. at 25 (citing, inter alia, Seligman et al., supra note 12).
108 Id. These characteristics are: “appreciation of beauty, authenticity, bravery, creativity, curiosity, fairness, forgiveness, gratitude, hope, humor, kindness, leadership, capacity for love, love of learning, modesty,
strengths of nearly 300 law students against a sample of U.S. lawyers and six samples of non-
lawyers. They found that the law students surveyed “demonstrated a normal range of
characteristics, similar to other intelligent, highly educated samples.” Consequently, they
conclude that the “supposed presence of a negative ‘lawyer personality’ might be overstated.”

If it is true that there is no such “negative ‘lawyer personality’”—that it is untrue that
“lawyers are . . . unhappy people [who] somehow self-select their own unhappiness by
subconsciously placing themselves in a depressing profession”—a question remains whether
and to what extent law school and the profession itself contributes to lawyer distress. These are
discussed in turn below.

B. LAW SCHOOL

A significant, decades-long body of scholarship demonstrates that law school poisons the
well of prospective lawyers’ well-being. For instance, in a 1986 empirical study of law students
in Arizona, Andrew Benjamin and his colleagues found that law students were as
psychologically healthy as the general population entering law school, but within six months
“average scores on all symptom indices changed from initial values within the normal range to
scores two standard deviations above normative expectation.” These elevated symptoms
“significantly worsened” throughout law school, and they “did not lessen significantly between
the spring of third year and the next two years of legal practice.” They found that, depending
on the group, 17-40% of the student-subjects “suffered significant levels of depression,” with 20-
45% reporting “other significantly elevated symptoms, including obsessive-compulsive,
interpersonal sensitivity, anxiety, hostility, paranoid ideation, and psychoticism (social alienation
and isolation).” These elevated symptoms were not dependent on any demographic or
descriptive differences, including undergraduate or law school GPA; hours devoted to

open-mindedness, persistence, perspective, prudence, self-regulation, social intelligence, spirituality, teamwork, and
zest.”

undergraduate or law school studies or to work after graduation; bar examination passage; or size of law practice.\textsuperscript{117}

In the mid-2000s, Lawrence Krieger and Kennon Sheldon authored two influential studies of the negative effect law school has on the subjective well-being of law students.\textsuperscript{118} Krieger and Sheldon based their research on the “self-determination theory of optimal motivation and human thriving,” or “SDT,” which “focuses on the contextual and personality factors that cause positive and negative motivation, with corresponding positive and negative performance and subjective well-being (SWB) outcomes.”\textsuperscript{119} As Krieger and Sheldon describe elsewhere, there are essentially three central tenets of SDT relevant here. First is that “all human beings have certain basic psychological needs—to feel competent/effective, autonomous/authentic, and related/connected with others”; these experiences produce well-being, while their absence correlates to distress.\textsuperscript{120} Second, SDT posits that an individual’s “values, goals, and motivations” form the basis of their behavior, and “intrinsic values and internal motivations are more predictive of well-being than their extrinsic or external counterparts.”\textsuperscript{121} Finally, SDT also posits that supervisors, teachers or mentors who provide “autonomy support” to their subordinates “enhances their [subordinates’] ability to perform maximally, fulfill their psychological needs, and experience well-being.”\textsuperscript{122} Put simply, SDT research posits that:

(i) why a person acts—i.e., for internal satisfaction or external factors; (ii) what a person seeks through their actions—i.e., intrinsic goals such as personal growth and community or extrinsic

\textsuperscript{117} Id. at 246.

These affect and satisfaction factors provide data on complementary aspects of personal experience. Although moods are experienced as transient, they have been found to persist over time in stable ways. Positive and negative affect are purely subjective, straightforward experiences of “feeling good” or “feeling bad” that many people would interpret as happiness or its opposite. Life satisfaction, on the other hand, includes a personal (subjective) evaluation of objective circumstances—such as one’s work, home, relationships, possessions, income, and leisure opportunities. This measure of life satisfaction . . . is validated by its use in previous social science research and is broader than the concept of career or job satisfaction . . . .

\textsuperscript{119} Sheldon & Krieger, Undermining Effects, supra note 112, at 263.

\textsuperscript{120} Krieger & Sheldon, What Makes Lawyers Happy?, supra note 12, at 564.

\textsuperscript{121} Id. at 564-65. As Krieger and Sheldon explain, “[v]alues or goals such as personal growth, love, helping others, and building community are considered ‘intrinsic,’ while ‘extrinsic’ values include affluence, beauty, status, and power.” Id. Additionally, “motivation for behavior is distinguished based on the locus of its source, either ‘internal’ (the behavior is inherently interesting or enjoyable, or it is meaningful because it furthers one’s own values) or ‘external’ (behavior is compelled by guilt, fear, or pressure, or chosen to please or impress others).” Id.

\textsuperscript{122} Id. at 565. Krieger and Sheldon describe “autonomy support” as when authorities or superiors “support and acknowledge their subordinates’ initiative and self-directness.” Sheldon & Krieger, Longitudinal Test of Self-Determination Theory, supra note 118, at 884. When they do so, “those subordinates discover, retain, and enhance their intrinsic motivations and at least internalize nonenjoyable but important extrinsic motivations. In contrast, when authorities are controlling or deny self-agency of subordinates, intrinsic motivations are undermined and internalization is forestalled.” Id.
goals such as fame and money; and (iii) the level of autonomy support one has from their superiors, all have “significant consequences for [their] satisfaction and performance,” as well as their overall SWB. \(^ {123}\)

In their first study, Krieger and Sheldon found that law students enter law school with a positive subjective well-being compared with undergraduates. \(^ {124}\) Yet, one year into law school, students suffered a decline in subjective well-being and an increase in physical and mental health problems. \(^ {125}\) These declines in well-being and increases in health problems continued throughout law school. \(^ {126}\)

In particular, they found that these increases in mental and physical distress corresponded with decreases in positive affect and overall life satisfaction. \(^ {127}\) They also corresponded with shifts in their reasons for becoming lawyers—from internal purposes (such as interest and meaning) to external ones (such as money and recognition) \(^ {128}\)—as well as decreases in values of all kinds after the first year. \(^ {129}\)

Krieger and Sheldon conclude in this study that students’ “endorsement of intrinsic values” declined over the first year, with a shift toward the extrinsic “appearance and image values.” \(^ {130}\) Additionally, students’ goals and motivations moved from the internal—“reasons of interest and enjoyment”—to the external, notably “pleasing or impressing others.” \(^ {131}\) Strikingly, Krieger and Sheldon also found that this shift was not limited to the first year, as “neither the losses in SWB nor in relative intrinsic value orientation rebounded” during law school; \(^ {132}\) in fact, during the second and third years of law school, all types of valuing decreased. \(^ {133}\)

Krieger and Sheldon did find, however, that students who acted “for intrinsic and self-determined reasons” tended to “perform more persistently, flexibly, creatively, and effectively,” and therefore attain a higher GPA. \(^ {134}\) However, they note the “potential irony” to this finding, because although such students with intrinsic motivations and values performed well academically, such high-performing students “tended to shift toward more lucrative, high-

\(^ {132}\) Id.

\(^ {133}\) Id. at 282. Krieger and Sheldon observe that this finding is “consistent with the common stereotype that lawyers ‘have no values’”—that they are hired guns willing to represent any position that promises to pay.” Id.

\(^ {134}\) Id. at 281; cf. Peterson & Peterson, supra note 97, at 411 (reporting results of survey of George Washington University Law School students that revealed “students who use their strengths on a regular basis report higher satisfaction with life and lower levels of stress and depression).
prestige career preferences.” And, as discussed below, the values associated with these positions “tend to contribute to decreased health, SWB, and career satisfaction over time.”

In a 2007 study, Krieger and Sheldon further investigated the negative effects of law school on students’ SWB. It adds to the first study by examining the more nuanced components of SDT—the level of satisfaction of the students’ psychological needs for autonomy, competence, and relatedness to others—as well as the autonomy support students receive from faculty at two different schools, one whose faculty has a “traditional,” scholarly focus, and one whose faculty is “less traditional” and focused more on teaching and practical skills for students. As is relevant here, the study confirmed the findings of their first study, particularly that students’ SWB and internal motivation decreased and their distress increased throughout law school. In particular, they found that these negative outcomes resulted from decreases in students’ satisfaction in their needs for autonomy, competence, and relatedness since entering law school.

Thus, these studies, among others, have demonstrated that law students suffer disproportionately high levels of distress and suggest that this distress correlates to law school itself. These elevated levels of mental health and addiction issues among law students remain high today. In 2014, Jerome Organ, David Jaffe, and Katherine Bender surveyed more than 3,300 students across fifteen law schools to assess mental health and substance abuse issues among students as well as whether and to what extent students seek help for these issues. They found that 17% of respondents screened positive for depression, 37% screened positive for anxiety, 43% reported binge-drinking at least once in the prior two weeks, 25% was at risk for alcoholism, and 35% used illicit street drugs or prescription drugs without a
prescription. Additionally, a 2014 non-empirically validated survey of students at Yale Law School found that up to 70% of its students suffer from some form of self-identified mental distress while in school.

The reasons why law school causes such declines in well-being and rises in mental health and substance abuse among its students is beyond the scope of this Article, but suffice it to say that as a result of the law school model, students experience many of the same distress, mental health, and addiction issues that pervade the legal profession, and it may lay the groundwork for that very pervasiveness.

C. LAW PRACTICE

In 2015, Krieger and Sheldon conducted an empirical study of nearly 8,000 lawyers throughout the United States across all areas of practice to determine the contributors to lawyer well-being and life satisfaction, as well as distress and dissatisfaction. In designing their study, they measured SWB the metrics discussed above (need satisfaction, values, and motivations) as well as depression and alcohol consumption.

Consistent with their prior studies of law students, Krieger and Sheldon found that internal values and motivations—the very factors that erode during law school—and psychological need satisfaction were most strongly predictive of lawyer well-being, whereas the “[e]xternal factors emphasized in law school and by many legal employers” were “at best, only modestly associated with lawyer well-being.” The strongest predictors of well-being were the psychological needs of autonomy, relatedness to others, and competence, as well as motivation. They determined that the correlations between psychological needs and lawyer well-being were “[e]xceptionally strong,” and that these needs were strongly inversely correlated with depression as well as inversely correlated with quantity of drinking.

Accordingly, aspects of the profession that inhibit these psychological needs, and that foster external values and motivations, can contribute to lawyer mental health and addiction

appears to have become more prevalent than two decades ago.” Id. at 127.

issues. While a myriad of such aspects certainly exist, analyzed below are some of those primarily addressed in the literature as contributors to lawyer distress. Some of the aspects below affect multiple psychological needs, but are organized according to the need to which they most correspond.

1. Lack of Autonomy

Autonomy is one of the key metrics for attorney happiness, and its absence in “high-pressure, low decision latitude” positions of law firm associates render associates “likely candidates for negative health effects,” such as depression. While there are many areas of the profession that engenders a lack of autonomy, this Article focuses on two: the reliance on the billable hour as a measure of productivity and compensation and the low decision latitude of particularly junior lawyers.

a. Reliance on the Billable Hour

The prevailing business model for law firms over the last several decades is the billable hour, by which they charge their clients an hourly rate for each hour each attorney works. As law firms have commodified over the last thirty-five years, hour expectations have increased. For instance, in the early 1980s, few law firms had minimum billable hour requirements, but in recent years “most large law firms expressly set them at 1,900 to 2,000,” with some firms expecting much more.

Billable hours as a benchmark of productivity is counter-intuitive, as “the behavior that...”

159 Id. at 582-84 & figs. 1-2; accord Eaton et al., supra note 9, at 1086 (“[P]eople in occupations that involve individual autonomy, control over the environment, and direction and planning of the flow of work will be protected against depression.”)

160 Seligman et al., supra note 12, at 42.

161 Eaton et al., supra note 9, at 1086 (“Occupations involving little or no direction or control contribute to a relatively stable personality configuration linked to learned helplessness, which has been implicated in depression.”).

162 See generally HARPER, supra note 19. Although billable hours can bear on autonomy and relatedness satisfaction (as well as motivation), see Krieger & Sheldon, supra note 12, at 596, but is included as related to “competence” because it rewards inefficiency. Cf. DEBORAH L. RHODE, THE TROUBLE WITH LAWYERS 13 (2015) (“[T]he hourly billing system pegs profits more to the quantity of time spent than to the efficiency of its use, and profits have become the dominant concern. High billable hour quotas also screen out individuals with competing values. A willingness to work long hours functions as a proxy for commitment.”).

163 HARPER, supra note 19, at 79 (2013); accord Update on Associate Hours Worked, NALP BULL. (2016), https://www.nalp.org/0516research (reporting that nearly 60% of law firms require attorneys bill at least 1,900 hours); but see CENTER FOR THE STUDY OF THE LEGAL PROFESSION & REUTERS LEGAL EXECUTIVE INSTITUTE, 2019 REPORT ON THE STATE OF THE LEGAL MARKET 7 fig. 8 (reporting that the average attorney at 161 U.S.-based law firms surveyed billed 122 hours per month in 2018, or 1464 hours per year).

maximizes hours is antithetical to true productivity.”165 While productivity generally is the “relative measure of the efficiency of a person . . . in converting inputs into useful outputs,” the general benchmark of lawyer productivity—the total time spent on a task without regard to the quality or utility of the work product—is a measure of anything but productivity. 166 Indeed, more hours spent on a task is an indication of unproductivity, as workers are less productive and efficient the longer they toil on a task.167 Nevertheless, despite the “productivity” misnomer, the billable hour system rewards unproductivity and inefficiency.

Notwithstanding this inherent inefficiency, billable hours are the standard measure of work, and law firm associates understand that their futures depend on this measure of output, and their success at the firm requires them to bill much more than the firm’s stated billable hour target.168 Moreover, an attorney must “work” many more hours to hit their billable target. For instance, Yale Law School calculated that an attorney must be at work 2,420 hours to bill 1,800, and that 2,200 billable hours requires an attorney be “at work” 3,048 hours.169 It is no wonder, then, as the American Bar Association’s Commission on Women in the Profession warned nearly twenty years ago, that “[e]xcessive workloads are a leading cause of lawyers’ disproportionately high rates of reproductive dysfunction, stress, substance abuse, and mental health difficulties.”170 As one lawyer put it, billable hours are “the biggest reason lawyers are so depressed.”171

b. Low-Decision Latitude

Beyond the number of hours worked, many lawyers—particularly junior lawyers172—

165 HARPER, supra note 19, at 78.

170 AM. BAR ASS’N, COMM’N ON WOMEN IN THE PROFESSION, BALANCED LIVES: CHANGING THE CULTURE OF LEGAL PRACTICE 12 (2001). Cf. Debra Austin & Rob Durr, Emotion Regulation for Lawyers: A Mind is a Challenging Thing to Tame, 16 WYO. L. REV. 387, 401 (2016) (“A lawyer subjected to chronic stress can experience emotional disorders such as anxiety, panic attacks, or depression, and physical problems such as irritability, breathlessness, dizziness, abdominal discomfort, muscle tension, sweating, chills, heart palpitations, chest pains, and/or increased blood pressure.”).
171 Joshua E. Perry, The Ethical Costs of Commercializing the Professions: First-Person Narratives from the Legal and Medical Trenches, 13 PENN. J.L. & SOC. CHANGE 169, 184 n.57 (2009-10). But see Krieger & Sheldon, What Makes Lawyers Happy?, supra note 12, at 596 (finding that while “important psychological predictors decreased” with increased billable hours, such increases only led to “slightly less happiness”); but see also Bergin & Jimmieson, supra note 60, at 437 (finding that high billing attorneys “experienced greater anxiety, more stress, more job dissatisfaction and less work/life balance,” but that their study “did not provide evidence that having high billing targets was related to greater levels of depression and drinking, compared with lawyers with low-to-moderate billing targets or no billing targets”).
172 However, despite their higher status and 62% greater pay than senior associates, junior partners “experience no greater happiness than the associates.” Krieger & Sheldon, What Makes Lawyers Happy?, supra
experience distress because they lack autonomy in the work that they do. Associates have little say over their work, limited interaction with senior partners, and little to no client contact. With this lack of autonomy also comes isolation, as firms have little “mentoring, training, or firm citizenship behaviors,” and there is little institutional incentive to engage in them. Consequently, lawyers feel alienated from their work and cannot see how it matters beyond as a billable deliverable. As an illustration, in one survey of associates at an international law firm, 86% said they have “non-interesting work,” 88% said they do not have interaction with partners, and 77% said they are not “being shown appreciation for their work by senior associates or partners.”

Junior lawyers have expressed “angst over pressures to bill exorbitant amounts of money to clients to whom they felt no meaningful connection.” They also have expressed frustration over the conflict between their “presumed role as autonomous professionals” who establish and maintain client relationships and their “more subservient role as employees” who exist to generate partner revenue.

Additionally, with advances in technology, lawyers are increasingly on-demand around the clock. Lawyers are expected to be reachable at all times, and in effect are constantly on call. With this, lawyers have less autonomy support—that is, superiors do not acknowledge the lawyers’ perspective or preferences, or provide them with meaningful choices about when and how to work and how to balance their lives. While technology makes it possible for lawyers to work from home, it also makes it virtually impossible not to work from home; consequently, “[p]ersonal lives get lost in the shuffle.” This “effective monitoring” of lawyer work at all times is true not only of junior lawyers, but also for senior lawyers who fear losing clients for being unresponsive on demand.

note 12, at 597-98; cf. Jonathan Koltai et al., The Status-Health Paradox: Organizational Context, Stress Exposure, and Well-Being in the Legal Profession, 59 J. HEALTH & SOC. BEHAV. 20, 31 (2018) (finding that “higher-status lawyers have a mental health disadvantage relative to their peers in the public sector and are no better off in terms of health”). In the words of one law firm partner: “The hours don’t get any better for partners; partners have even more pressure than associates do.” Kimberly Kirkland, Ethics in Large Law Firms: The Principles of Pragmatism, 35 U. MEM. L. REV. 631, 683 (2005).

2. **Lack of Relatedness: Adversarial System**

The practice of law is inherently adversarial, which itself is inherently stressful by nature. To thrive in the adversarial system, lawyers are trained to be competitive and aggressive because the goal is to “win.” Such training is “fueled by negative emotions,” and as a consequence “can be a source of lawyer demoralization, even if it fulfills a social function.” Consequently, when the practice of law is reduced to many zero-sum disputes, it can produce “predictable emotional consequences for the practitioner, who will be anxious, angry, and sad much of [their] professional life.” Moreover, dealing with difficult opponents, clients, and colleagues can often leave lawyers feeling “emotionally shattered.”

3. **Extrinsic Values and Motivations**

Lawyers often enter a firm culture “that is hostile to the values [they] have.” As Judge (then-Professor) Patrick Schiltz observed: “The system does not want you to apply the same values in the workplace that you do outside of work . . .; it wants you to replace those values with the system’s values. The system is obsessed with money, and it wants you to be, too. The system wants you—it needs you—to play the game.”

As a result of this “game,” law is no longer seen by many as a calling, but as a “just a

---

183 See Seligman et al., *supra* note 12, at 47. A recent study of American and Canadian lawyers revealed that lawyers at large firms experience higher rates of “depressive symptoms and risk of poor health” than those in smaller firms or the public sector, including because such lawyers have “higher levels of overwork” and work-life conflict. Koltai et al., *supra* note 172, at 31-32.

188 *Id.* (citation omitted).
189 There are essentially three different mindsets about which people have about their work: jobs, careers, and callings. See, e.g., Amy Wrzesniewski et al., *Jobs, Careers, and Callings: People’s Relations to Their Work*, 31 J. RES. IN PERSONALITY 21, 22 (1997). Briefly, a job is “a means that allows individuals to acquire the resources needed to enjoy their time away from” it; a career is a position in which one has “a deeper personal investment in their work and mark their achievement not only through monetary gain, but through advancement within the occupational structure,” which “often brings higher social standing, increased power within the scope of one’s occupation, and higher self-esteem for the worker”; and a calling is a position one “works not for financial gain or [c]areer advancement, but instead for the fulfillment that doing the work brings for the individual.” *Id.* Individuals who view their work as callings generally have “greater life, health, and job satisfaction and . . . better health” than those who view their work as mere jobs or careers. See *id.* at 28, 30-31; *see also id.* at 27 tbl. 3. A person can find their calling within any occupation. See *id.* at 22; *cf. id.* at 31 (finding each mindset represented in nearly equal thirds among sample administrative assistants, concluding that “[s]atisfaction with life and with work may be more dependent on how an employee sees his or her work than on income or occupational prestige”).
job with ridiculous hours, stress, and unpaid law school debt,” and a primary focus on generating revenue for the firm. This “loss of purpose beyond making money” contributes greatly to lawyer dissatisfaction, and it should come as no surprise that along with well-being, lawyers believe legal professionalism is in decline as well. As a consequence, there has been a call for a return to more traditional notions of law practice, one that prioritizes integrity, civility, and community. More generally, if lawyers “re-discover why they became lawyers in the first place” and rededicate themselves to the intrinsic goals and motivations that initially led them to law school, it will lead to a “happier, healthier, and more ethical profession.”

III. IGNORING THE MORAL CASE FOR LAWYER WELL-BEING

Notwithstanding the existence and the profession’s knowledge of the widespread prevalence of attorney mental health and addiction issues, as well as some obvious costs associated with them, law firms (and the profession at large) have ignored the pleas for change. These pleas have largely rested on moral grounds. Yet they have gone unheeded largely for two reasons: (i) firms have cared primarily about their bottom lines; and (ii) the stigma associated with mental health and addiction issues, as well as other barriers to treatment.

A. THE PROFIT-CENTERED PRACTICE: COMMIDIFICATION OF LAW FIRMS

Over the past thirty-plus years, firms have moved from the idea of the “noble profession” and toward the profit-maximizing “business model” dominating private practice today. As a result of the American Lawyer first publishing its annual list of firms’ revenues and profits-per-partner in 1985, attorneys were able to discover how much their colleagues were making elsewhere, and earning a high spot on the “Am Law 100,” or firms with the top 100 revenues nationwide, was a coveted honor. In response, firms adopted management techniques aimed

---

191 BARRY SCHWARTZ & KENNETH SHARPE, PRACTICAL WISDOM: THE RIGHT WAY TO DO THE RIGHT THING 216-17 (2010). Moreover, increased compensation does not contribute to lawyer subjective well-being, see Krieger & Sheldon, What Makes Lawyers Happy?, supra note 12, at 583 fig. 1, 597-98; in fact, public interest lawyers responding to Krieger and Sheldon’s survey reported greater subjective well-being than their highly-paid “elite” and “prestige” lawyers at private firms. Id. at 590-91 & 593 tbl. 1.

192 Bowling, supra note 190, at 48; see also Krieger & Sheldon, What Makes Lawyers Happy?, supra note 12, at 612 (noting that survey respondents “has a positive view of neither the justice in the justice system nor the professional behavior of professionals in the system”).

CAPITALIZING ON HEALTHY LAWYERS

at moving them up in the annual rankings. As a consequence, total gross revenue for Am Law 100 firms has gone from $7 billion in 1985 to $71 billion in 2010—a 9.71% compound annual growth rate—to $98.75 billion in 2018.

Moreover, “[m]anaging partners admit publicly that they run their firms to maximize instant profits for relatively few”—the partners. And, to that end, their practices have been successful: while in 1985 the average profits-per-partner for the firms on the inaugural Am Law 50 list was $300,000, that figure for the top fifty firms in the Am Law 100 in 2011 had risen to $1.6 million, and to $2.54 million in 2018.

Partner profits are maximized through the so-called “Cravath model” that focuses on high leverage, high hourly rates, and high billable hours.

First, a firm’s leverage is the ratio of all attorneys to equity partners. The higher the leverage means the more salaried attorneys (i.e., associates, counsel, and non-equity partners) a firm has to equity partners; the higher the leverage, the more money the firm’s equity partners make. To achieve higher leverage, firms hire many more associates than they expect to be promoted to equity partnership (or even remain with the firm beyond a few years). Put simply, it is in firms’ interest to hire many associates with the expectation to make few, if any, partner, because more associates means more profits for partners, and fewer partners means a larger share for each. This practice has yielded considerable results. Since the creation of the Am Law 100, leverage ratios have grown considerably: between 1985 and 2010, the average leverage ratio for the top fifty Am Law 100 firms doubled from 1.76 to 3.54, and it rose to 4.47 in 2018, with, as noted above, the average profits per equity partner at $2.54 million.

210 Am Law 100 2019, supra note 199. Average leverage ratio of top fifty firms by total revenue.
211 Id.
Second, firms’ hourly rates have risen steadily both before and after the Great Recession of the late 2000s, with many firms raising their rates at a rate of 5% after the Recession, and the top twelve firms raising rates more than 7%. Finally, the third component of the Cravath model is high billable hour expectations. As discussed in Part II.C.1.a above, as law firms have commodified over the last thirty-five years, hour expectations have increased from no minimum billable hour requirements in the early 1980s to at or above 2,000 hours today.

Thus, as a result of the Cravath model, a firm achieves its success (i.e., maximizing revenue and profits per partner) by hiring large classes of associates each year and requiring them to work long hours for the years preceding their eligibility for partnership. This model not only keeps equity partner wealth growing by the continuous influx of new junior associates, but it also leads to significant attrition such that few associates last long enough even to be considered for equity partner. As firms have adopted the Cravath model, they have reinvented themselves as profit-generating businesses by which only a few partners at the top truly benefit.

Even though firms have produced considerable revenue, partners are not content with their existing wealth; they think they should be making more money. Consequently, firms’ short-run focus on the maximization of annual profits has also become their “most important long-run goal.”

As partner profits and firm revenue have increased so too has lawyer distress and dissatisfaction. While firms and their equity partners have achieved staggering wealth it has come at considerable costs, as lawyer mental health and addiction issues have become pervasive. The added income (as well as the client expectations arising from higher billing rates) brings an assumed obligation to work longer hours, often at the expense of lawyers’ health and personal lives. In other words, as set out in Part II.C above, law firms in general are undermining its attorneys’ internal values and motivations that foster subjective well-being in

fear of prioritizing the external values and motivations that correlate to emotional distress.\textsuperscript{221}

It is likely that a “disturbingly large number” of Big Law lawyers would acknowledge that their exorbitant salaries have not brought them happiness.\textsuperscript{222} In fact, some likely would be willing to take less salary if it meant a more balanced life.\textsuperscript{223}

Since money—profit generation and maximization—is at the heart of much of the distress and dissatisfaction within the profession,\textsuperscript{224} the answer to address such distress and dissatisfaction is not to provide additional financial incentives.\textsuperscript{225} Studies abound demonstrating that money, at a certain level below the median lawyer salary, does not increase happiness.\textsuperscript{226} Nevertheless, firms have done just that: they have responded in recent years to increased lawyer distress, dissatisfaction, and attrition by increasing salary. This has continued even in the wake of the Krill Study and the ABA’s \textit{Path to Lawyer Well-Being}: in Summer 2018, many firms began to raise their starting salary for a first-year associate to $190,000 (if not higher), with an eighth-year associate’s salary far exceeding $300,000.\textsuperscript{227}

\begin{multicols}{2}
\textsuperscript{221} See \textit{supra} Part II.C; see also Schiltz, \textit{supra} note 12, at 903 (“Money is at the root of virtually everything that lawyers don’t like about their profession: the long hours, the commercialization, the tremendous pressure to attract and retain clients, the fiercely competitive marketplace, the lack of collegiality and loyalty among partners, the poor public image of the profession, and even the lack of civility.”).

\textsuperscript{222} Harper, \textit{supra} note 19, at 97.

\textsuperscript{223} Id. (arguing lawyers would do so because “their work remains a persistently depressing experience, largely because it seems unfulfilling, unrelenting, or both”). But see Schiltz, \textit{supra} note 12, at 904-05 (“Lawyers could enjoy a lot more life outside of work if they were willing to accept relatively modest reductions in their incomes. . . . But many of them do take the money. [They] choose to give up a healthy, happy, well-balanced life for a less healthy, less happy life dominated by work. And they do so merely to be able to make seven or eight times the national median income instead of five or six times the national income.”).

\textsuperscript{224} See Schiltz, \textit{supra} note 12, at 903 (“Money is at the root of virtually everything that lawyers don’t like about their profession: the long hours, the commercialization, the tremendous pressure to attract and retain clients, the fiercely competitive marketplace, the lack of collegiality and loyalty among partners, the poor public image of the profession, and even the lack of civility.”).

\textsuperscript{225} Indeed, “[l]ife satisfaction in the United States has been flat for fifty years even though GDP has tripled. Even scarier, measures of ill-being have not declined as gross domestic product has increased; they have gotten much worse. Depression rates have increased tenfold over the last fifty years in the United States. . . . Rates of anxiety have also risen.” Martin E.P. Seligman, \textit{Flourish: A Visionary New Understanding of Happiness and Well-Being} 223 (2011).

\end{multicols}
B. STIGMA AND BARRIERS TO TREATMENT

Although awareness and understanding of mental illness has increased in recent years, it is still not often treated legitimately or seriously “either by businesses, by the health care system, or by society.”228 This is true in the legal profession, in which “mental health ‘is not talked about openly,’” and, for years, has been kept “‘underground.’”229

The profession recognizes that this stigma exists. A 2018 survey of Managing Partners and Human Resources at Am Law 200 law firms revealed that stigma associated with mental illness and substance abuse is prevalent in the profession.230 In particular, 81% of those surveyed believe a stigma exists against those suffering from depression and 75% believe a stigma exists against those suffering from anxiety.231 The numbers are even starker for those with substance abuse problems, with 94% of those surveyed believe a stigma exists against both those suffering from alcohol addiction and a drug addiction.232

The stigma pervades the profession in a variety of ways. First, there is fear that attorneys struggling with mental health or addiction disorders are incompetent, incapable, or undesirable. This is succinctly captured by the comments of the chairman of an Am Law 100 law firm, who expressed reticence to follow other firms in having an on-site psychologist because of the fear that “‘our competitors will say we have crazy lawyers.’”233

Second, the overwhelming majority of state bars ask questions relating to applicants’ mental health or substance use. Many states have historically asked bar applicants whether they had any history of mental health treatment. Even after a 2014 Department of Justice settlement with the Louisiana Supreme Court in which the state agreed to remove questions from its bar application about an applicant’s mental health history, several states still ask whether applicants

229 William Roberts, When Counsel Needs Counseling, WASH. LAWYER (Jan. 2018), at 20 (quoting Arent Fox LLP partner David Dubrow); see also Zimmerman, supra note 5 (“Law firms have a culture of keeping things underground, a conspiracy of silence,’ [Dr. Daniel Angres, an associate professor of psychiatry at Northwestern University Feinberg School of Medicine] said. ‘There is a desire not to embarrass people, and as long as they are performing, it’s easier to just avoid it. And there’s a lack of understanding that addiction is a disease.’”). In a 2017 New Yorker profile, former Acting Attorney General Sally Yates discussed her father’s suicide in 1986, for which she said: “‘Tragically, the fear of stigma then associated with depression prevented him from getting the treatment he needed.’” Ryan Lizza, Why Sally Yates Stood Up to Trump, NEW YORKER (May 29, 2017), http://www.newyorker.com/magazine/2017/05/29/why-sally-yates-stood-up-to-trump
230 ALM INTELLIGENCE, 2018 MENTAL HEALTH AND SUBSTANCE ABUSE SURVEY.
231 Id.
232 Id. Additionally, the stigma for drug use may be further internalized; in the Krill Study, less than 27% of participants responded to questions concerning drug use, compared with approximately 90% for questions relating both to mental health and alcohol use. Krill et al., supra note 9, at 48-50; see also id. at 52 (“Because the questions in the survey asked about intimate issues, including issues that could jeopardize participants’ legal careers if asked in other contexts (e.g., illicit drug use), the participants may have withheld information or responded in a way that made them seem more favorable.”).
233 Randazzo, supra note 21 (citation omitted).
have any such history.\textsuperscript{234}

In all, as of 2019, out of forty-nine states,\textsuperscript{235} the District of Columbia, Guam, Northern Mariana Islands, Puerto Rico, and the Virgin Islands, all but seven ask some question related to the bar applicant’s mental health or substance use.\textsuperscript{236} In particular, twenty-nine ask questions about the applicant’s current mental health or substance abuse,\textsuperscript{237} with an additional eight asking about the applicant’s past as well as current mental health or substance abuse.\textsuperscript{238} Four states ask questions regarding past and current substance use but ask only about current mental health issues.\textsuperscript{239} Three states have questions about current substance abuse but do not have any questions regarding mental health,\textsuperscript{240} and an additional state asks about substance abuse treatment but not about mental health.\textsuperscript{241} Finally, two states asks about past and current instances of mental illness but only current instances of substance abuse.\textsuperscript{242}

As one example, the Michigan Bar asks the following questions of its applicants:

Have you ever used, or been addicted to or dependent upon, intoxicating liquor or narcotic or other drug substances . . . [or h]ave you ever had, been treated or counseled for, or refused treatment or counseling for, a mental, emotional, or nervous condition which permanently, presently or chronically impairs or distorts your judgment, behavior, capacity to recognize reality or ability to cope with ordinary demands of life[; . . . or] which permanently, presently or chronically impairs your ability to exercise such responsibilities as being candid and truthful, handling funds, meeting deadlines, or otherwise representing the interest of others?\textsuperscript{243}

It is no surprise, then, that lawyers are reticent to seek treatment.\textsuperscript{244} Lawyers with mental health and addiction issues have “pervasive fears surrounding their reputation” that prevent them

\textsuperscript{234} See Alyssa Dragnich, \textit{Have You Ever . . . ?}, 80 BROOK. L. REV. 677, 677 (2015)
\textsuperscript{235} Bar application for Nevada was not reviewed. All applications are on file with the author.
\textsuperscript{236} The seven states that do not ask any questions about the applicant’s mental health or substance use are Arizona, Connecticut, Illinois, Massachusetts, Tennessee, Virginia, and Washington.
\textsuperscript{237} Alabama, Alaska, Colorado, Delaware, District of Columbia, Guam, Idaho, Indiana, Kansas, Kentucky, Louisiana, Maryland, Mississippi, Montana, Nebraska, New Hampshire, New Mexico, New York, North Carolina, North Dakota, Northern Mariana Islands, Oklahoma, Puerto Rico, Rhode Island, South Carolina, South Dakota, Vermont, Virgin Islands, and Wyoming.

from availing themselves of the help that they need.245 Accordingly, the two most common barriers for treatment for substance abuse are: (i) not wanting others to find out they needed help; and (ii) concerns regarding privacy or confidentiality.246

The statistics demonstrate that these are real barriers to meaningful treatment: only 6.8% of attorneys surveyed in the Krill study reported seeking treatment for substance use; the two most common barriers—among those who sought and have not sought treatment—are “not wanting others to find out they needed help” and “concerns regarding privacy or confidentiality.”247 The results are even starker for law students. Only 4% of respondents ever sought help for substance use.248 And while 42% of respondents indicated that they thought they needed help for mental health issues, only approximately half have done so.249 Further, the greatest reported barriers to seeking treatment include “potential threat to job or academic status,” “potential threat to bar admission,” and “social stigma.”250

IV. THE BUSINESS CASE FOR PROMOTING AND PRIORITIZING LAWYER WELL-BEING

As discussed in Part I above, calls have been made to humanize the legal profession for decades.251 However, throughout most of that time, as the Path to Lawyer Well-Being acknowledged, the profession at large generally has “turned a blind eye” to the pervasiveness of and not done enough to address mental health and addiction issues among its members.252 As discussed in Part II.C above, many aspects of the law firm model negatively impact lawyer subjective well-being, which inversely correlates to depression and mental distress.253 And, as argued in Part III above, law firms and the profession in general have turned this “blind eye” and ignored the moral case for promoting lawyer well-being because they have not had the financial incentives to change the existing law firm model.

This Part demonstrates how and why it is in law firms’ business interest to promote and prioritize its lawyers’ well-being.254 First, this Part argues that law firms incur significant direct and indirect costs related to untreated lawyer mental health and addiction issues. Second, this Part summarizes some of the initial steps taken by firms in recent years to begin to acknowledge and address lawyer well-being issues. Finally, this Part argues that while current efforts are important first steps, the time is ripe for firms to benefit financially from enacting lasting and

253 See supra Part II.C.
254 To date, no study has been done to monetize the cost to the legal profession attributable to untreated mental health and addiction disorders, or the corresponding financial gains to the profession by prioritizing attorney well-being. Accordingly, Part will look to as instructive studies in other and across professions.
meaningful change to promote and prioritize lawyer well-being, most notably because doing so will: (i) improve lawyer performance as clients are placing a premium on lawyer and staffing that prioritizes efficiency; and (ii) help with law firm retention, as that not only creates efficiencies but continuous relationships are increasingly demanded by clients; and (iii) recruitment, particularly as younger Millennial and Generation Z lawyers—who prioritize mental health and well-being—enter the profession.

A. THE COSTS OF UNDERMINING LAWYER WELL-BEING

All professions incur significant costs due to untreated employee mental health and addiction issues. Mental health disorders are by far the most burdensome illnesses to United States employers—costing over $200 billion each year—well exceeding the cost burden of heart disease, cancer, stroke, and obesity. Further, the cost of alcohol abuse in the United States is $249 billion, with 72% of that total cost—or over $179 billion—resulting from losses in workplace productivity.

As recognized by the World Health Organization, the “consequences of mental health problems in the workplace” include, among other things: poor work performance (including “reduction in productivity and output,” “increase in error rates,” and “poor decision-making”) as well as an “increase in disciplinary problems”; absenteeism as well as “loss of motivation and commitment . . . burnout [and] diminishing returns”; and turnover. That is no different in law firms, where the costs that firms experience due to untreated lawyer mental health and addiction issues include: (i) lawyer discipline actions; (ii) absenteeism and presenteeism; and (iii) costs associated with high attrition. Each is discussed in turn below.

1. Lawyer Discipline: Malpractice and Sanctions

There can be no question that attorneys who have untreated mental health of addiction disorders can engage in conduct that gives rise to attorney discipline or malpractice actions. For instance, according to the ABA, between 40-70% of disciplinary proceedings and malpractice claims against lawyers involve substance use, depression, or both. Further, a separate ABA survey in New York and California determined that “50 to 70 percent of all

---

258 See, e.g., Badgerow, supra note 48, at 2 (noting that an “alarming number” of complaints against lawyers for ethics violations “involve lawyers’ use of and dependence upon drugs and alcohol . . . and descent into depression”).

259 PATH TO LAWYER WELL-BEING, supra note 14, at 8.
disciplin ary cases involved alcoholism.” Reports from other states find similar percentages.261

2. Absenteeism and “Presenteeism”

In addition to the direct costs of health care and, for lawyers, malpractice and sanctions, firms suffer indirect costs from attorneys struggling with mental health issues. According to one study, businesses suffer over $102 billion in indirect costs annually due to the absenteeism and “presenteeism” of its depressed employees. Absenteeism is the amount of work (in hours or days) an employee loses due to illness or otherwise being absent from work. “Presenteeism,” as the name suggests, is the amount of work an employee loses while at work because they are unproductive or under-productive. Mental health and substance abuse issues affect both.

Depression substantially reduces an employee’s ability to work, as it both increases absenteeism and reduces productivity while at work. According to one study, depression doubles the annual sickness days among employees, and results in 2.3 days per month of lost productivity. Another study found that employees with mental illness reported losing between 4.3-5.5 days of productive work in the prior thirty days. On average, workers with depression have 3.7 times more unproductive time at work per week than those without depression, and depressed employees generally have “trouble concentrating, greater difficulty in making

Simon et al., Recovery from Depression, Work Productivity, and Health Care Costs Among Primary Care Patients, 22 Gen. Hosp. Psych. 153, 153 (2000) (noting that “current depression is associated with an increase of 2 to 4 disability days per month”); accord id. at 154 (“[D]epression is responsible for a tremendous economic burden on employers and insurers.”)

decisions, and decreased interest in work.”

In addition to lost work days and lost productivity, the cost of absenteeism and presenteeism to employers can be monetized. For example, a 2003 study found worker absenteeism and presenteeism due to depression results in costs of $44 billion in 2002 dollars to employers. Additionally, according to another study, 71% of employer expenditures on employee mental health issues are for lost productivity due to presenteeism.

Moreover, the combination of long hours and all-day availability invariably leads to a lack of sleep. Not only does fatigue compromise effectiveness, but sustained lack of sleep both leads to cognitive impairment and can lead to or exacerbate depression. With respect to the former, fatigue “impair judgment and decision making.” For instance, a person who averages four hours of sleep a night for four or five nights will be as cognitively impaired as someone who is legally intoxicated or who has been awake for twenty-four straight hours. Within ten days, the level of impairment is the same as going forty-eight straight hours without sleep, which significantly impedes judgment, interferes with problem-solving, and delays reaction times.

With respect to the latter, lack of sleep is a “major risk factor in the onset, recurrence, chronicity, and severity” of major depressive episodes. Accordingly, sleep habits are

---

269 Kumar et al., supra note 262, at 583; see also Wang et al., supra note 266, at 1887 (finding that major depression “was associated with decrements of approximately 12 points in task focus and approximately 5 points in productivity on their 0-100 scales . . . equivalent to a 0.4 standard deviation increase in task focus and a 0.3 standard deviation decrease in productivity”).

270 Stewart et al, supra note 271, at 3141 tbl. 4.

272 Lack of sleep is a natural outgrowth of long hours and total accessibility, and lack of sleep is seen as the cost of exceptional client service. See, e.g., Deborah L. Rhode, Balanced Lives for Lawyers, 70 FORDHAM L. REV. 2207, 2211 (2002) (“A common assumption is that client service requires total accessibility.”); cf. Susan Saab Fortney, The Billable Hours Derby: Empirical Data on the Problems and Pressure Points, 33 FORDHAM URB. L.J. 171, 182 (2005) (reporting on survey finding 35.7% of attorneys reported sleeping an average of five-to-six hours per night and three percent reported sleeping an average of less than five hours per night).

important and modifiable risk factors to help prevent depression or achieve and maintain depression remission.278

Given law firms’ reliance on the billable hour as the measure of both lawyer productivity and firm profitability, presenteeism could be seen as a way to maximize profits—after all, a lawyer who can bill more for a task will make more for the firm. However, as discussed below, clients are demanding firms increase efficiency—both in their services and the methods for which they bill them—thus making presenteeism costly for firms.

3. Replacement Costs and High Attrition

Mental health and addiction issues can contribute to lawyer attrition. In general, attrition rates among lawyers is high. In 2016, law firms lost an average of 16% associates.279 As a general matter, 44% of associates depart within three years of being hired, and 75% depart within five years.280 Moreover, a 2016 survey found that 40% of attorneys surveyed were “likely” or “very likely” to be looking for a new job within the next twelve months.281 According to one estimate, the cost of replacing a departing associate ranges from $200,000 to $500,000, or roughly one-and-a-half to two times the annual salary of that lawyer.282 This cost—which could include advertising, recruiter’s time and salary, interviewing expenses, and training—does not account for implicit costs. Such costs, including lost productivity time, covering the work of the departing lawyer, and disrupted intrafirm and client relationships, “can dwarf the explicit expenses.”283 Thus, taking the midpoint and ignoring the implicit cost of attrition, associate attrition costs a 100-lawyer firm $5.6 million and a 500-lawyer firm $28 million.284

Fritz et al., Embracing Work Breaks: Recovering from Work Stress, 42 ORG. DYNAMICS 274, 275 (2013) (“Employees who do not completely recover during the weekend (i.e., they feel that a free weekend is not enough time to recover from the work week) over time are at an increased risk for depressive symptoms, fatigue, energy loss, and cardiovascular disease.”).

REV. 421, 427 (2010) (“The average cost to a law firm when an associate leaves has been documented at $315,000; while others estimate that it costs a firm 150% of a person’s annual salary when she quits.”).
283 LEVIT & LINDER, supra note 12, at 162 (citation omitted); see also RHODE, supra note 162, at 15; Peter H. Huang & Rick Swedloff, Authentic Happiness & Meaning at Law Firms, 58 SYR. L. REV. 335, 336 (“Attrition of associates is costly to law firms, in terms of money, morale, reputation, and time.”); Seligman et al., supra note 12, at 33 (“Unhappy associates fail to achieve their full potential at a cost to them, their firms, their clients, and even their families.”).
284 100 lawyers x 16% = 16; 16 x $350,000 = $5,600,000. 500 lawyers x 16% = 80; 80 x $350,000 = $28,000,000.

Further, firms that fail to adequately promote the well-being of their attorneys may face the cost of attrition when that failure is seemingly most acute. For example, after Gabe McConaill’s death (see supra notes 1-4 and accompanying text), “a number of employees” reportedly left his firm’s Los Angeles office, purportedly because “they thought that the firm’s leadership did not respond sufficiently in the wake of [his] death,” and that “there was
B. INCREMENTAL EFFORTS TO ADDRESS LAWYER WELL-BEING

In the wake of the ABA’s 2017 call to action in its *Path to Lawyer Well-Being*, some law firms and other legal employers have begun to, at least, recognize the mental health and addiction issues in the profession, and some have taken incremental steps to promote the well-being of their attorneys. While first steps are helpful toward addressing the crisis, there is still a long way for the profession to go to enact meaningful and lasting change.285

As an initial step, some firms have at least begun to acknowledge that mental health and addiction problems exist in the profession. For instance, in a Summer 2018 survey of managing partners and human resources officials at Am Law 200 law firms on mental health and substance abuse, 86% of those surveyed either agreed or strongly agreed that depression occurs at their firm, and 93% agreed or strongly agreed that anxiety occurs at the firm.286 Further, 90% agreed or strongly agreed that alcohol abuse occurs at the firm, and 48% agreed or strongly agreed that drug abuse occurs at the firm.287 And these firms recognize that their cultures contribute to these problems: when asked to rank the “causes of substance abuse and mental health problems in the law firm environment,” 79% of respondents listed “stress and workload” as the principle cause.288

As an additional step, in September 2018 the American Bar Association launched a campaign seeking to “raise awareness, facilitate a reduction in the incidence of problematic substance use and mental health distress and improve lawyer well-being.”289 To that end, the ABA developed a “seven-point framework for building a better future” for lawyer well-being,290

no clear commitment to support employees who . . . found [the firm’s] demanding corporate culture an unwelcome environment in which to raise a hand” to seek help. Lilah Raptopoulos & James Fontanella Khan, *The Trillion-Dollar Taboo: Why it’s Time to Stop Ignoring Mental Health at Work*, FIN. (noting the “huge canyon between where the profession is now and where we might otherwise want it to be”).

286 ALM INTELLIGENCE, 2018 MENTAL HEALTH AND SUBSTANCE ABUSE SURVEY, supra note 231.

287 *Id.*

288 *Id.* In conducting the survey, the surveyors “noted that ‘discussing substance abuse and mental health issues has often been considered taboo in the legal industry.’” Patrick Krill, *ALM Survey on Mental Health and Substance Abuse: Big Law’s Pervasive Problem*, LAW.COM (Sept. 14, 2018), available at https://www.law.com/2018/09/14/alm-survey-on-mental-health-and-substance-abuse-big-laws-pervasive-problem/. The survey yielded a response rate of only 15%, which “would seem to suggest that the taboo is alive and well.” *Id.; see also supra* notes 230 – 232 and accompanying text.

290 These seven points are: (i) “Provide enhanced and robust education to attorneys and staff on topics related to well-being, mental health, and substance use disorders”; (ii) Disrupt the status quo of drinking-based events”; (iii) “Develop visible partnerships with outside resources committed to reducing substance use disorders and mental health distress in the profession . . .”; (iv) “Provide confidential access to addiction and mental health experts and resources, including free, in-house, self-assessment tools”; (v) “Develop proactive policies and protocols to support assessment and treatment of substance use and mental health problems, including a defined back-to-work policy following treatment”; (vi) “Actively and consistently demonstrate that help-seeking and self-care are core cultural values, by regularly supporting programs to improve physical, mental[,] and emotional well-being”; and
and requested firms sign a pledge of support for the ABA’s campaign. The pledge provides as follows:

Recognizing that substance use and mental health problems represent a significant challenge for the legal profession, and acknowledging that more can and should be done to improve the health and well-being of lawyers, we the attorneys of [FIRM] hereby pledge our support for this innovative campaign and will work to adopt and prioritize its seven-point framework for a better future.291

Thirteen law firms initially signed the pledge.292 The ABA called upon “all legal employers” to take the pledge by January 1, 2019,293 as of April 2019, only ninety-one law firms (and twenty-three other organizations) had done so.294

In addition to acknowledging mental health and addiction issues and pledging to take theoretical steps to improve lawyer well-being, firms have been beginning to take concrete steps to address them,295 with some even predating the ABA’s formal call to action in its Path to Lawyer Well-Being. These programs include continuing education courses, visiting speakers, online resources, and social opportunities promoting healthy lifestyles, as well as employee assistance programs and direct access to professional services.296 For instance, since 2016 Kirkland & Ellis has offered yoga, meditation, and wellness training to its lawyers.297 In 2017, (vii) “Highlight the adoption of this well-being framework to attract and retain the best lawyers and staff.” See Challenging the Status Quo: A Campaign of Innovation to Improve the Substance Use and Mental Health Landscape of the Legal Profession, available at https://www.americanbar.org/content/dam/aba/administrative/lawyer_assistance/ls_colap_working_group_pledge_a nd_campaign.authcheckdam.pdf (last visited Sept. 20, 2019).

291 Pledge Commitment Form, available at https://www.americanbar.org/content/dam/aba/administrative/lawyer_assistance/ls_colap_working_group_pledge_c ommitment_form.authcheckdam.pdf (last visited Sept. 20, 2019).

297 Claire Bushey, Kirkland & Ellis to Offer Wellness Training to All U.S. Lawyers, CRAIN’S CHICAGO BUS. (May 2, 2016), https://www.chicagobusiness.com/article/20160502/NEWS04/160509972/kirkland-ellis-to-offer-
the New York and Washington, D.C. offices of Hogan Lovells started offering on-site psychologists to its employees\(^298\); also in 2017, Akin Gump Strauss Hauer & Feld began offering to its attorneys the services of on-site behavioral assistance counselors as part of its overall “Be Well” program, which it started the year before.\(^299\) Further, in 2019, Morgan Lewis launched an employee well-being program entitled “ML Well,” and created a “Director of Employee Well-Being” position.\(^300\)

Moreover, beyond firms themselves, some state bars have taken action to eliminate questions on bar applications relating to an applicant’s mental health history. In February 2019, the Conference of Chief Justices, in recognition that questions about mental health history, diagnoses, or treatment are “unduly intrusive” and “likely to deter individuals from seeking mental health counseling or treatment,” passed a resolution urging state and territorial bar authorities to eliminate such questions from bar applications.\(^301\) The Conference resolved that it is reasonable to ask about an applicant’s mental health history “only . . . if the applicant has engaged in conduct or behavior and a mental health condition has been offered or shown to be an explanation for such conduct or behavior.”\(^302\) Consistent with the Conference’s resolution, in 2019 three states—Connecticut,\(^303\) Virginia,\(^304\) and Wisconsin\(^305\)—removed questions relating to applicants’ mental health history (except when offered as a defense to conduct). Further, California and New York began examining whether they should remove such questions from their respective bar applications.\(^306\) As a consequence of this examination, in July 2019 California enacted legislation prohibiting its state bar from seeking applicants’ mental health

\(^302\) Id.

These pioneering steps are a helpful—and much needed—start to addressing lawyer mental health and addiction issues and well-being issues more generally. However, more firms and legal employers need to take action to enable meaningful, profession-wide change. And, of the efforts currently being made by firms, there is some concern that, however well-meaning, they “lack the teeth to address the toughest of the issues,” or are “little more than window dressing—a way for firms to check a box and show they are making a difference while avoiding the more complex process of a true reckoning.” As one associate put it, “the fixes being offered [by firms] are ‘like a band-aid over a bullet wound.’”

It would be counterproductive to reject this progress as less than the complete culture change or paradigm shift needed to address attorney mental health and addiction issues in meaningful ways. Incremental progress could allow the profession to build the bridge toward the systemic changes the profession needs. However, those systemic changes needed may come about more quickly if firms recognize not just the social good in prioritizing their attorneys’ well-being (which has long been one of the principal justifications in calls for systemic change), but the benefits that will inure to the firms’ bottom lines and profit margins. The next Part explains why the time is right for these systemic changes, and why it is in firms’ financial interests to make them.

C. THE FINANCIAL BENEFITS OF LASTING AND MEANINGFUL CHANGE

The time is right for firms to prioritize lawyer well-being in part because we are at a tipping point in mental health awareness. While stigma about mental health certainly still exists—particularly in law firms—people involved in entertainment, sports, and

309 Packel, supra note 295.

311 Id. (“Standing on the edge [of the canyon] while complaining about the width of the chasm won’t do anything to narrow its yawn.”)

312 Id.

313 See supra notes 230 – 232 and accompanying text.

315 See, e.g., Kevin Love, Everyone is Going Through Something, PLAYERS’ TRIBUTE (Mar. 6, 2018),
politics have all raised awareness of mental health and addiction issues by coming forward to share stories of their personal struggles. Further, many other industries have taken steps to prioritize mental health. And, while “law firms remain 20 years behind corporate America when it comes to taking measures to improve mental health,” it is in firms’ interest to catch up to other professions and industries as prioritizing attorney well-being will help firms recruit the best talent.

As noted above, the profession has made progress, and both recognizing the problems and taking incremental steps to address them are positive steps. This should be acknowledged and applauded. But making lasting, meaningful change in the profession requires a shift in the paradigm within which firms operate at both the organizational and profession-wide levels. After all, as one law firm consultant observed, “the mixed messages sent when a firm says ‘go use our meditation room but make sure you bill 2,000 hours or you won’t get your bonus’ need a broader fix that may require more people in the room than those focused purely on mental health.” As the ABA recognized in The Path the Lawyer Well-Being, “[b]road-scale change requires buy-in and role modeling from top leadership.”

That buy-in from firm leadership—i.e., those that have helped create and perpetuate the commodification of the legal profession as well as the stigma attached to lawyers with mental health and addiction issues—will not come unless and until that leadership sees a potential return on such an investment.

As explained in Part IV.A above, law firms and legal employers experience costs when lawyer mental health and addiction issues are unaddressed. A number of interventions can significantly lessen the burden of depression or anxiety in the workplace, and specifically work-related interventions can have a positive role in maintaining mental health and facilitating

317 See generally infra notes 332 – 336 and accompanying text.
318 Packel, supra note 295.
319 Id.
recovery from depression or anxiety. Therefore, primary and secondary prevention approaches demonstrate “either moderate or strong efficacy in terms of reducing symptom severity.”

Thus, workplace interventions and treatment initiatives can help obviate the costs discussed above. Moreover, these interventions lead to reductions in health care costs (and therefore insurance premiums). The costs associated with promoting wellness are significantly outweighed by the financial benefits. According to one study, for every dollar a company spends on employee wellness programs, medical costs fall by $3.27 and increased costs attributed to employee absenteeism fall by $2.73. Further, more generally, a 2016 study estimated that every dollar spent to “scale up” treatment for mental illness between 2016-2030 within the 36 largest nations will yield $4.00 in increased productivity and the ability to work.

In addition to these financial savings, healthier workers are more productive, and prioritizing attorney well-being will likely help with attorney retention and recruitment. This is especially true now, with the growth of alternative fee as opposed to traditional hourly fee structures and the increasing importance Millennial and now Generation Z lawyers and law students place on mental health and work-life balance.

As set forth below, firms that prioritize attorney health and well-being similarly will see the indirect benefits of: (i) better performance from its attorneys and staff; (ii) better retention; and (iii) better yield of incoming attorneys through recruitment.

1. **Performance: Client Demands for Efficiency**

As discussed in Part IV.A.2 above, mental health and addiction disorders result in increased absenteeism and presenteeism. Indeed, the stress faced by lawyers results not only in a decline in their well-being and rise in anxiety, panic attacks, depression, substance abuse,
and suicide, but also in diminished cognitive capacity. It is no surprise, then, that treatment for depression “significantly improve[s] productivity” and improves absenteeism, and substance abuse treatment similarly greatly reduces both presenteeism and absenteeism. Consequently, as a practical matter, more engaged employees generate higher business incomes. And, as recognized by a study of federal employees, employees are “significantly more likely” to receive high performance ratings if they participate in wellness programs, employee assistance programs, or similar wellness-based policies.

Recognizing this, several companies have engaged in what Whole Foods founder John Mackey and economist Raj Sisodia have termed “conscious capitalism”—a system whereby businesses “simultaneously create[] multiple kinds of value and well-being for all stakeholders: financial, intellectual, physical, ecological, social, cultural, emotional, ethical, and even spiritual.” As they explain, conscious businesses “place a huge emphasis on improving the health and well-being of their team members,” under the belief that when employees are healthy, the company not only generates higher revenue (because the employees do better work and provide better services to customers) but it also spends less money on health care. As a consequence, such businesses “enhance the[ir] bottom line” through programs that promote employee health and well-being, including onsite gyms, nutrition programs, work/life balance programs, mindfulness training, and stress management classes. These businesses take their employees’ physical and mental health seriously, and they “encourage positive emotional energy in the workplace to promote intellectual vigor and enhance productivity.”

327 Austin, supra note 152, at 796-97.
328 Rost et al., supra note 263, at 1206; see also id. at 1208 (“The improvements in absenteeism and productivity we observed in the total cohort were largely due to the improvements consistently employed workers realized from intervention.”)
330 James K. Harter et al., Business-Unit-Level Relationship Between Employee Satisfaction, Employee Engagement, and Business Outcomes: A Meta-Analysis, 87 J. APPLIED PSYCHOL. 268, 275 (2002) (noting “the correlation between employee engagement and business incomes, even conservatively expressed, is meaningful from a practical perspective”); see also id. (“On average, business units in the top quartile on the employee engagement measure produced 1 to 4 percentage points higher profitability.”). Accord Sonja Lyubomirsky et al., The Benefits of Frequent Positive Affect: Does Happiness Lead to Success?, 131 PSYCHOL. BULL. 803, 803, 840 (2005) (noting the correlation between happiness among employees and business success because “positive affect engenders success,” and it also “affect[s] the following resources, skills, and behaviors: sociability and activity, altruism, liking of self and others, strong bodies and immune systems, and effective conflict resolution skills.”).
331 FEDERAL WORK-LIFE SURVEY GOVERNMENTWIDE REPORT, supra note 325, at 9; see also generally id. at 36-41.
333 Id. at 96.
334 Austin, supra note 152, at 798.
335 EDWARD M. HALLOWELL, SHINE: USING BRAIN SCIENCE TO GET THE BEST FROM YOUR PEOPLE 31 (2011). Moreover, corporations have increasingly recognized their commitment to all stakeholders beyond shareholders. For instance, in August 2019, the Business Roundtable—an association of CEOs of America’s leading companies—issued a “Statement on the Purpose of a Corporation,” in which it announced their respective corporations are committed to, among other things, “[i]nvesting in our employees.” Business Roundtable, Statement on the Purpose of a Corporation (Aug. 19, 2019), https://opportunity.businessroundtable.org/ourcommitment/.
Unsurprisingly, conscious businesses perform exceptionally well financially. For instance, a sample of conscious businesses outperformed the overall stock market by a ratio of 10.5:1 over a fifteen-year period from 1996-2011. These businesses delivered more than 1,646% returns when the market was up only 157% over that period.336

Moreover, research on mindfulness and happiness generally are instructive on the benefits of well-being to employee performance. First, beyond formal wellness programs, firms that promote mindfulness can help to manage and reduce lawyer distress and also to enable their lawyers to provide exceptional client service.337 Practicing mindfulness can help attorneys feel and perform better,338 improve attorney decision-making,339 ethics 340 and even active listening and negotiation skills.341 In fact, attorneys at an international law firm reported a 45% increase in focus, a 35% decrease in stress, and a 35% increase in effectiveness after completing a firm-sponsored mindfulness program.342

Second, happiness research has demonstrated that happiness correlates to successful outcomes because “positive affect engenders success.”343 While happiness is inextricably linked to work satisfaction, as “[the number one determinant of happiness is a ‘good job’: work that is meaningful and done in the company of people we care about],” happiness is actually the cause of success, not merely the result.344

In fact, studies have found a strong correlation between happy employees and objective and subjective measures of productivity,346 and as a general matter positive affect can improve not only skills important for effective lawyering (such as sociability, altruism, and conflict

They also enjoy more job security and are less likely to take sick days, to quit, or to become burned out.”); EMMA SEPPÄLÄ, THE HAPPINESS TRACK 7-11, 152-61 (2016).
resolution), but physical health as well.\textsuperscript{347} As explained by happiness researcher Shawn Achor, engaged workers perform better because they often “experience positive emotions, including happiness, joy, and enthusiasm; experience better health; create their own job and personal resources; and transfer their engagement to others.”\textsuperscript{348}

Moreover, lawyers who are more connected to their colleagues are not only healthier, but more productive. Just as a negative environment can impact employees negatively, a positive environment can impact them positively. Research demonstrates that we can “pick up negativity, stress, and apathy” from others; simply observing a co-worker’s stress “can have an immediate effect upon our own nervous system, raising our levels of the stress hormone cortisol by as much as 26 percent.”\textsuperscript{349} By contrast, “the presence of even one positive person in a community can actually ‘infect’ everyone in it with positivity.”\textsuperscript{350} Put differently, working with positive, engaged, motivated people enhances our own positivity, engagement, motivation, and creativity.\textsuperscript{351} Thus, in creating an environment that cultivates attorney well-being, the improved well-being of one or some lawyers will affect positively those around them, thus making teams, departments, and firms more productive and successful.

That healthier employees perform better is critical in the legal profession for several reasons, but notably because of recent client demands for attorney efficiency. As explained in Part III.B.1 above, firms could avoid addressing lawyer well-being issues on performance-related grounds because its business model was one that thrived on and financially rewarded inefficiency—the billable hour. Over the last few years, however, clients have caused law firms to move away from the traditional hourly-billing model and toward “alternative fee arrangements,” or a “mutual agreement between a law firm and [client] for billing and payment of outside legal services that does not rely on straight hourly billing by the firm.”\textsuperscript{352} Such arrangements include fixed price agreements, success fee agreements, contingency pricing, and other alternatives to the traditional billable hour.\textsuperscript{353}

The rise of nontraditional billing is “[o]ne of the most potentially significant” changes to the profession in recent years, as it portends the “effective death of the traditional billable hour in most law firms.”\textsuperscript{354} As of 2017, alternative fee arrangements account for 15-20\% of law firm revenues; however, when combined with budget-based pricing, such alternatives to the billable

hour “may well account for 80 or 90 percent of all revenues.” Nearly 68% of all firms are working with clients to create alternative fee arrangements, and nearly 77% of firms with more than 250 lawyers are doing so.

Large companies are seeking to change the billing model for its outside counsel and are insisting on alternative fee arrangements. For instance, Microsoft enacted a “Strategic Partner Program” on July 1, 2017, which “plac[ed] a stronger focus on alternative fee arrangements, retainer payments, diversity and developing relationships with outside counsel that go beyond the billable hour.” At that time, approximately 55-60 percent of its outside counsel matters were billed on a non-hourly, alternative-fee basis, with the hope of raising that figure to “a very robust 90 percent” by mid-2019. Additionally, pharmaceutical company GlaxoSmithKline had 80 percent of outside legal work in 2017 done through an alternative fee arrangement, compared with just 3% in 2008.

In all, since 2008, clients have asserted more control over decisions regarding their legal representation and are “insisting on more value for their legal spend”—i.e., “higher levels of predictability, efficiency, and cost effectiveness in the delivery of legal services, quality being assumed.” Moreover, a 2019 survey revealed that 82% of in-house corporate counsel are seeking to cut their company’s legal spend over the next two years. Thus, since the billable hour model is one that is antithetical to productivity and efficiently—why finish a task efficiently in four hours when it could billed over six—clients are now demanding firms move away from this model, and instead will award their business to firms that demonstrate they can perform the work productively, efficiently, predictably, and cost-effectively. Accordingly, firms that prioritize lawyers’ well-being will be better equipped to meet client demands for exceptional yet efficient service.

2. Retention

As discussed in Part III.A.3 above, mental health and addiction issues can lead to high attrition rates. By contrast, firms that promote lawyer well-being will see improved retention

CAPITALIZING ON HEALTHY LAWYERS

rates. This is borne out by experiences in other industries; for example, conscious businesses typically operate with much lower levels of employee turnover, which avoids the replacement cost of new employee hiring and training.  

Moreover, general counsel at major corporations have begun to understand that balance in the lives of their outside lawyers can be an important factor in their companies’ bottom line. In fact, general counsel will consider lawyer attrition as well as the quality-of-life issues that affect attrition when making decisions of which outside firms to retain. These corporate clients recognize that the absence of balance contributes to high associate attrition rates in large law firms and that attrition, in turn, imposes costs that result from the loss of institutional knowledge and continuity. As the former senior vice president and general counsel of the Association of Corporate Counsel recognized more generally, the “greatest investment in any new lawyer” is in “developing the culture, support mechanisms and leadership initiatives that will ensure [that] lawyer’s success,” because firms will not only receive the “returns” generated by that lawyer, but the “larger benefits of cultivating a better work environment will rain down on everyone in the firm.” Indeed, in August 2019, 3M—whose legal department is itself a signatory to the ABA Wellness Pledge—has incorporated the Pledge into its requests for proposals from outside counsel by “Asking law firms if they have signed the pledge and what specific action they have taken to promote well-being among the lawyers and other legal professionals in their firm.”

Thus, firms that make efforts to retain their attorneys will not only avoid turnover costs and lose institutional knowledge about matters and clients as well as client relationships generally, it will help to foster and retain clients in the first place. And firms will be better equipped to retain their attorneys by taking steps to promote and prioritize their wellness and well-being.

364 Mackey & Sisodia, supra note 332, at 287. For instance, at the conscious business The Container Store, “turnover is less than 10 percent per year, in an industry that’s over 90 percent.” Id. at 89-90 (citation omitted). Additionally, Jet Blue enacted a peer-to-peer recognition program, in which one employee could nominate a coworker to be acknowledged for their performance; not only did this program lead to “significantly higher levels of employee performance and engagement,” it also led to an increase in retention. Achor, Big Potential, supra note 262, at 136-37.

365 Harper, supra note 19, at 174 (“No other company would treat its most important commodity poorly enough to cause a turnover rate of 85 percent for first year lawyers who are gone by the sixth year. Why are you doing it? How can you get away with that?”).

366 Fortney, supra note 272, at 189-90; see also id. (quoting one general counsel as saying they look to “retention issues, training, and flex time” when selecting outside counsel, as those issues “are all creeping into the alternative fee discussion”).

367 Harper, supra note 19, at 174.

368 Id. at 175.

The third area in which law firms will benefit will be in recruitment, particularly with respect to Millennial and, as they enter the profession, Generation Z lawyers. People in these younger generations suffer from “higher levels of depression, anxiety, and suicide ideation than they did a decade ago.” Indeed, in 2009, the average age of being diagnosed with depression was fourteen and a half, compared to twenty-nine in 1978.

Younger Millennials are now entering the profession, with older Millennials having as much as ten years or more in practice. That latter age cohort has increased a spike in mental health issues. A recent study by BlueCross BlueShield revealed that the prevalence of depression among Millennials has increased by 31% from 2014 to 2017, and is the top condition affecting Millennials by adverse health impact. Depression is 18% more prevalent for older Millennials than Generation Xers at the same age.

The trend is more concerning for the next generation. Generation Z’ers are “on the verge of the most severe mental health crisis for young people in decades.” Depression of middle- and high school-aged Generation Z children has “skyrocketed” between 2012 and 2015, a trend that exists across all demographic and socioeconomic classes. In fact, a 2015 study by the U.S. Department of Health and Human Services found that 56% more teens experienced a major depressive episode in 2015 than in 2010, and 60% more experienced severe impairment.

This trend has continued as Generation Z’ers have gotten older. They are increasingly entering college with mental health issues with nearly twice the number of incoming students in 2016 indicating they feel depressed than those who entered college in 2009. They are more likely to report feeling “overwhelming anxiety” and that they “feel so depressed they [can] not

Additionally, a 2019 study revealed that current 20- to 21-year-olds were 78% more likely to have experienced serious psychological distress in the last month than 20- to 21-year olds in 2008, and current 18- to 25-year olds are 71% more likely to experience such distress than 18- to 25-year-olds in 2008. In all, Generation Z’ers are 49% more likely than Millennials to have reported serious psychological distress in the past month.

Perhaps not surprisingly, then, Millennials prioritize work-life balance when choosing employment, even more than salary. As a general matter, Millennials seek meaning and purpose in their work and they seek supportive and nurturing work environments. In fact, a 2016 survey of Millennials revealed that, salary excluded, work-life balance is the most important characteristic a Millennial searches for when choosing a job. Other top considerations include leadership opportunities, a sense of meaning or purpose in their work, training, and the impact the work has on society—that is, the types of motivations and values that enhance one’s subjective well-being and, in turn, inversely correlate to depression. Thus, Millennials respond best to employers who convey “you matter to us”—that is, employers who see their employees’ humanity and well-being is integral to the company and its success.

With Generation Z beginning to enter law school and the profession, firms that address mental health and addiction issues and that foster a healthy environment will help attract these incoming interns and associates. They experience mental health issues in greater frequency than Millennials, and they are more likely to talk about and seek help for them.
In fact, law students on the Millennial/Generation Z cusp have made clear that mental health is a priority to them as they enter the legal profession. In its 2019 Summer Associates Survey, American Lawyer reported that 42% of respondents said they are concerned about their mental health, including because of the “structure of the legal industry.” Further, when asked to list their top three factors in considering an employment offer from a law firm, work/life balance was the most important factor among the respondents.

This prioritization of mental health and work/life balance is not an anomaly in this one survey, as young Millennial and Generation Z students are engaging in activism to promote and mental health in the profession. For instance, in 2019 the Virginia State Bar removed questions relating to mental health history and treatment in response to a student-led movement for it to do so, and several well-being-related programs at law schools are led by students. Younger Generation Z students are also campaigning for greater mental health awareness and treatment; for instance, in June 2019, in response to student activism, Oregon enacted a law that will allow students to take “mental health days” from school as an excused absence, just as they would a sick day. Thus, as they enter the workforce, they certainly will prioritize their mental health and well-being in choosing among employers.

Consequently, firms that prioritize attorney health and well-being will be attractive both to lateral lawyers who seek better balance as well as to younger and future lawyers who prioritize their own well-being.

393 Mattingly, supra note 304.

396 Human resources software company Zenefits found that “Gen Z-ers recognize that mental health in the workplace is important, and they are demanding benefits and workplace policies that acknowledge this reality.” Nicole Roder, Young Workers Demand Emphasis on Mental Health in the Workplace, ZENEFITS (Jan. 3, 2019), https://www.zenefits.com/blog/young-workers-demand-emphasis-on-mental-health-in-the-workplace/.
CONCLUSION

The legal profession has known for decades that its members suffer from mental illness and addiction in staggering numbers, and firms largely have been unmoved by the moral case for change. As the practice of law has become more of a business, firms can and will make changes to reduce costs, increase efficiencies, and improve profit margins. This Article argues not only that the profession should and should want to create a “better future for our lawyers” by making such changes, but that it is in its interest to do so. If firms do not want to make changes on moral grounds, they can and should at least make them on business ones. Put differently, why firms make these changes is not as important that they make them, and if it takes a cost-benefit analysis for firms and the profession to prioritize attorney well-being, so be it.
