BASIC AT TWENTY: RETHINKING FRAUD-ON-THE-MARKET

Donald C. Langevoort*

ABSTRACT: Twenty years after being decided, Basic Inc. v. Levinson is being interpreted and applied in interesting, sometimes jarring, ways. This paper looks at Basic's presumption of reliance in fraud-on-the-market cases and the ways in which contemporary courts are addressing such issues as (1) the level of efficiency that is necessary for the presumption to apply; (2) the role of market price distortion and loss causation in the class certification decision; and (3) the connections between materiality and reliance (Basic's two separate issues) in both class certification and on the merits. Basic set in motion much of the resulting confusion by making more of reliance – and market efficiency – than was needed, and then paying too little attention to the joint risks of indeterminacy and disproportionality in the liability threat created by fraud-on-the-market lawsuits. Had it taken a different route, or better explained the route it was taking, we might have seen early on that class recovery is better suited as a deterrence mechanism than a compensatory device. That makes a stringent approach to reliance, causation or class certification unnecessary – but also calls into question the idea that each investor has a “right” to recovery by trading at a distorted price. Instead, the law headed in precisely the opposite direction.

The Supreme Court's decision in Basic Inc. v. Levinson is now twenty years old. In the context of a Rule 10b-5 class action alleging that Basic had falsely denied that it was engaged in merger negotiations with Combustion Engineering before publicly announcing a deal in December 1978, the Court addressed two issues central to private securities litigation: first, the proper standard for the materiality of preliminary merger negotiations and similarly uncertain information; second, whether the reliance of open market sellers on the

* Thomas Aquinas Reynolds Professor of Law, Georgetown University Law Center. Thanks to Seung-Hyun Ryu for excellent research assistance.

misinformation could be presumed, thereby making common issues predominate among the victims so as to make class certification justifiable. Tens of billions of dollars have changed hands in settlements of 10b-5 lawsuits in the last twenty years as a result of what Basic said.

The materiality holding, on which the Court was unanimous, rejected an effort by some courts of appeals to draw restrictive bright lines as to what is material or not based on policy-driven factors such as business' need for predictability or the desire to protect corporate secrets. Basic stands for the proposition that materiality is about what is important to investors, nothing more and nothing less, and offers a way (the so-called "probability-magnitude" test) for estimating when speculative information is sufficiently important or not. That fact-specific, ex post emphasis on assessing importance to the reasonable investor has been followed faithfully by the lower courts, though critics still carp at its indeterminacy.

The "presumption of reliance" holding -- a 4-2 decision -- was both more powerful and more enigmatic. By the mid-1980's, all courts of appeals that had considered the question had invoked some kind of reliance presumption in order to make "fraud on the market" class actions certifiable. In that sense, the Court simply endorsed what was by then a solid line of precedent. But business groups had joined with the defendants in a vigorous effort to make Court see a burgeoning threat of private securities litigation that could be stopped in its tracks by rejecting the presumption. The majority refused, and so kept the

6 See, e.g., BRIEF FOR AMERICAN CORPORATE COUNSEL ASSOCIATION AS AMICUS CURIAE, 1987 U.S. S.Ct. Briefs LEXIS 1, filed May 18, 1987; BRIEF AMICI CURIAE OF
courtroom door wide open for investor lawsuits alleging open market frauds. Soon after Basic the number of such suits rose dramatically, adding fuel to the political firestorm about securities class actions and eventually leading Congress to enter the field with the Private Securities Litigation Reform Act in 1995. Though urged to do so by politicians and lobbyists pushing an aggressive reform package, Congress did not undo Basic’s presumption, and so the holding remains vital today.

Vital, but also under stress. Justice Blackmun’s majority opinion is deeply puzzling in a number of key respects, which has led lower courts to reinterpret it fairly freely. Predictably enough, whatever Basic’s original intent was has been lost to time. In Part I, my paper will revisit Basic’s presumption of reliance and the questions it left open. We then turn to two areas where recent appellate decisions have read Basic in interesting, sometimes jarring ways. Part II has to do with the level of scrutiny into market efficiency as part of assessing the presumption of reliance, exemplified by the First Circuit’s decision in In re Polymedica Securities Litigation.9 Part III then deals with what plaintiffs must demonstrate besides efficiency to gain the presumption and show that common issues predominate. How much of the merits of plaintiffs’ case, on such questions as whether the alleged misrepresentation or omission actually distorted the market price or produced the loss, needs to be resolved as part of the class certification decision? The most interesting case here is Oscar Private Equity Investments v. Allegiance,10 a 2007 Fifth Circuit decision. In addressing this, I also want to compare Basic with the Supreme Court’s 2005 decision in Dura Pharmaceuticals v. Broudo,11 which was about pleading and proving loss causation, but which Allegiance turns into a class certification issue. The conceptual and methodological contrast between Dura and Basic bears noting. I am

---

7 See note --- infra.
8 The initial bill introduced by then Congressman Christopher Cox, H.R. 10, would have undone Basic. See Joel Seligman, The Transformation of Wall Street 664-65 (3d ed. 2003); Testimony of Chairman Arthur Levitt Concerning Litigation Reform Proposals Before the House Subcommittee on Telecommunications and Finance, Committee on Commerce, February 10, 1995, available at www.sec.gov/testimony/1995 (opposing that provision, which was later deleted).
9 432 F.3d 1 (1st Cir. 2005).
10 487 F.3d 261 (5th Cir. 2007).
not the first to say this, but understanding cases like Allegiance requires that we take a harder look at Basic's choices twenty years ago to see exactly how and why.

Part IV reconnects Basic's supposedly separate holdings on reliance and materiality. Shortly after Basic, the political debate over the legitimacy of private securities litigation turned mainly to the question of whether too many fraud-on-the-market lawsuits were vexatious, strike suits brought simply for their settlement value. As Joel Seligman pointed out at the time and subsequent research seems to have confirmed, there probably is a stronger correlation between the merits and both the filing and settlement of these actions than critics claim. In all likelihood, the problem of uncertainty in plaintiffs' grounds for filing relates more to informational asymmetry (i.e., that the circumstances surrounding what was said and why are hidden from investors and their advocates) than simple lawyer opportunism, making circumstantial reckoning inevitable prior to discovery. Like it or not, this is largely what the PSLRA addressed.

But even if we agree that a large percentage of fraud-on-the-market suits are based on at least plausible suspicions rather than imaginary factual claims, there is another cause for concern -- the possibility that issuer damage liability may be disproportionate to the underlying conduct, particularly in a setting in which liability standards are severely indeterminate. The presumption of reliance substantially expands, if not creates, what is often multi-billion dollar exposure for the issuer and its shareholders, which is acceptable only if we believe that the merits of the case warrant that level of liability to a particular class of investors in addition to the expenses of litigation. My final aim in this paper is to take a fresh look at Basic's materiality holding, which -- though amply justifiable as a resolution to the narrow question posed to

16 For a very perceptive but infrequently cited article saying this about Basic, see Dennis Karjala, A Coherent Approach to Misleading Corporate Announcements, Fraud and Rule 10b-5, 52 Alb. L. Rev. 957 (1989).
the Court -- obscures a joint risk of indeterminacy and disproportionality. My sense is that the demonstrable judicial discomfort with class certification notwithstanding Basic is driven by doubts about this as much as by lingering concerns about vexatiousness (on which, after all, Congress spoke forcefully in 1995). There may be no easy solutions, but assessing Basic at age twenty depends at least on seeing the connection.

I. REVISITING BASIC

Some facts about Basic might be surprising to the contemporary reader: First, we tend to think of the case as dealing with whether companies have the freedom to hide preliminary merger negotiations from public scrutiny in order to make them more likely to come to fruition. That is certainly how academic commentators have viewed it, and a lively debate ensued as to whether and when securities law should permit issuers to lie in order to serve their shareholders. But nowhere in the litigation was this interest ever put forth by Basic’s lawyers. To the contrary, Basic said that it never lied in the first place, and had nothing it wanted or needed to conceal. The district judge agreed after a thorough review of the record developed during extensive discovery, and granted summary judgment for the defendants.

Second, the defendants had a striking run of bad luck on appeal. The Sixth Circuit's recitation of the facts was a nightmare for Basic, ignoring without explanation many key inferences the district judge had said clearly showed that there had been no lie, much less a material one. It summarily reversed the district court. And when the case went up to the Supreme Court, the line-up of justices was remarkably skewed. Justice Lewis Powell -- the Court's long-time corporate-securities law specialist, for whom arguments stressing predictability and

17 See, e.g., Jonathan Macey & Geoffrey Miller, Good Finance, Bad Economics: An Analysis of the Fraud on the Market Theory, 42 Stan. L. Rev. 1059, 1075 (1990)(the lie was an effort to protect Combustion's investment in identifying Basic as a good acquisition candidate). This debate in the law reviews about whether and when lying to investors should be permitted because some lies, at least, can increase or protect shareholder value. See also Ian Ayres, Back to Basics: Regulating How Corporations Speak to the Market, 77 Va. L. Rev. 945 (1991); Marcel Kahan, Games, Lies and Securities Fraud, 67 N.Y.U. L. Rev. 750 (1992).
19 Levinson v. Basic Inc., 786 F.2d 741 (6th Cir. 1986).
proportionality in business litigation were tailor-made\textsuperscript{20} -- retired a few months after certiorari was granted, and his successor, Justice Kennedy, was not sworn in until a few months after the oral argument. Two other key conservatives, Chief Justice Rehnquist and Justice Scalia, took no part in hearing the argument or writing the opinion. \textit{Basic} was decided by only six, mostly liberal, justices.

Finally, the \textit{Basic} opinion was for all practical purposes authored by the SEC and the Solicitor General's Office. The key arguments, analysis, quotes and citations that one finds in the Court's holdings on both materiality and reliance come directly out of the \textit{amicus curiae} brief filed on behalf of the SEC.\textsuperscript{21} The fact that the government intervened on behalf of the plaintiffs on both these issues is interesting: after all, this was late in the Reagan years, and the business community would have had natural allies inside the SEC and the Justice Department to press the government come in on the other side, or at least stay on the sidelines. The case might well have come out differently if it had, at least on the presumption of reliance.

The key move on the reliance issue comes at the outset, when the Justice Blackmun's majority opinion states that reliance is an essential element of a cause of action under Rule 10b-5.\textsuperscript{22} That was not inevitable: the Court could have said that causation was the only requirement, with reliance as one (but not necessarily the only) way of demonstrating a causal link between the lie and harm to the plaintiff. Had the Court taken this route, the rest of the opinion would have been fairly simple and straightforward. But it did not, probably because this was now a time (a decade after \textit{Hochfelder},\textsuperscript{23} \textit{Santa Fe},\textsuperscript{24} etc.) by which 10b-5's roots in the common law of deceit were fairly deep, and fraud orthodoxy insists on proof of reliance. Once it kept reliance as an

Thomas Sullivan & Robert Thompson, \textit{The Supreme Court and Private Law: The Vanishing Importance of Securities and Antitrust}, 53 Emory L.J. 1571 (2004)(noting that Powell was influential in determining which securities law cases were taken and how they came out). Powell voted to grant certiorari in \textit{Basic}, though only on the materiality issue. See Pritchard, supra, at 897 n. 343.

\textsuperscript{22} 485 U.S. at 243-44.

\textsuperscript{23} \textit{Ernst & Ernst v. Hochfelder}, 425 U.S. 185 (1976)(requiring scienter in 10b-5 cases).

\textsuperscript{24} \textit{Santa Fe Indus. v. Green}, 430 U.S. 462 (1977)(requiring deception in 10b-5 cases).
essential element for each claimant, however, the majority had to explain how the typical investor relies on a corporate misrepresentation or omission and why that kind of reliance is so pervasive that it can be deemed "common" among all purchasers or sellers of issuer securities during the time in question.

Basic cannot be understood except by appreciating that the Court’s response is more about evidence and civil procedure than financial economics. Starting with its references to classic texts like Louisell & Muller's *Federal Evidence* and *McCormick on Evidence*, the opinion is an essay on the law of presumptions, how and when they are justified. The analysis is pragmatic: presumptions make judges work manageable, are useful responses to uncertainty, and help pursue sound public policy. We don't always need to know for sure, at least at pre-trial stages of a lawsuit; an educated guess will do, especially when it assists parties (here, investors) favored within the statutory regime.

So how does the Court justify the presumption of reliance? Certainly not by presuming that all investors actually read, heard or were otherwise aware of the alleged misrepresentation; that would be wildly unrealistic. An alternative would be to borrow from the efficient market hypothesis -- an intellectual innovation that was profoundly influencing scholarship in both law and economics in the mid-1980’s, and beginning to affect policy-making as well -- and presume that investors consider stocks accurately priced, so that there is no sense in spending time and money trying to outguess the market. That would be a good reason for any given investor not to read 10-K’s or do other research: for investors so inclined, and there are many (including index investors and others with widely diversified portfolios), this presumption would make a great deal of sense. There are strong hints of this in the opinion, as when the majority refers to the market "as the unpaid agent of the investor,

---

26 The majority was substantially aided by two earlier Supreme Court decisions that had used presumptions of reliance to obviate the need for difficult factual determinations in other private contexts. See 485 U.S. at 243, citing Mills v. Electric Auto-Lite, 396 U.S. 375 (1970); Affiliated Ute Citizens v. United States, 406 U.S. 128 (1972).

27 See Langevoort, *Theories*, supra.
informing him that given all the information available to it, the value of
the stock is *worth* the market price.28

That vision of efficiency is how many courts and commentators
have since come to understand *Basic's* presumption. But if so, it is
hardly much more realistic than the first way of thinking about reliance.
For all the passive index investors, there are millions of others who
fervently believe in their (or their broker or adviser's) ability to beat the
market -- billions of dollars are certainly spent trying.29 If passivity is
the basis for the presumption of reliance in an effort to find that common
issues predominate, it is a hopeless fiction. The decision would then rest
on very fragile grounds as a matter of civil procedure because there
really is no such commonality to reliance, and the class of investors
invited to seek recovery would be grossly inflated.30

Midway through its discussion of presuming reliance, however,
Justice Blackmun suggests a different and much more capacious idea:
that investors rely not so much on the accuracy of the stock price as its
"integrity."31 That is to say, most all investors implicitly assume that the
stock price has not been distorted by fraud. Even if they are hunting
bargains and trying to outguess the market, they are using the current
market price as an unbiased reference point to decide whether to buy,
sell, sell short, engage in options trading, etc. Put more concretely, a
seller of Basic Inc. stock may well have been assuming that the company
had not misled the market even in the course of deciding that the market
had overvalued Basic's stock, so that it was a good time to sell. This
version of the reliance story is what likely prompted the Court, for
example, to make its often-quoted gambling reference -- "Who would
knowingly roll the dice in a crooked crap game?"32

---

28 485 U.S. at 244, quoting In re LTV Sec. Litig., 888 F.R.D. 134, 143 (N.D. Tex.
1980)(emphasis added).
30 See Langevoort, *Theories*, supra, at 895-96. Other articles on *Basic* have also noted
this muddle. See Barbara Black, *The Strange Case of Fraud on the Market: A Label in
Search of a Theory*, 52 Alb. L. Rev. 923 (1989); Nicholas Georgakopoulos, *Fraud,
Markets, and Fraud on the Market: The Tortured Transition of Justifiable Reliance
31 485 U.S. 246-47.
32 Id., citing Schlanger v. Four-Phase Systems Inc., 555 F. Supp. 535, 538 (S.D.N.Y.
1982).
This would more plausibly justify a class-wide presumption of reliance, and thus is almost certainly the better reading of *Basic*. But it also raises questions. First, we have to ask why reasonable investors would ever make this assumption. Fraud and manipulation are common enough that it would be foolish for anyone simply to *assume* that a stock price has integrity. In an efficient market, the inevitable risk of fraud is priced and investors compensated for taking on the risk -- the market is certainly not assuming its absence.

A careful reading of this portion of the Court's opinion, however, indicates that the justices are not so much describing commonplace reliance as deciding that investors *should* be able to rely on stock price integrity. In other words, they are creating an entitlement for reasonable investors to rely on stock price integrity because that is consonant with Congressional intent behind the securities laws, and then presuming that actual reliance reasonably follows the entitlement. This is hardly a radical move: the common law of fraud is the judicial creation of an entitlement to rely on representations of fact by strangers whether or not there is any reason to trust them, because doing so facilitates economic exchange. But Justice Blackmun does not say this (it is not even clear whether he realizes it), perhaps because this policy-making style of justification dates from an earlier interpretive era rather than the more contemporary strict-constructionism, where the Court is supposed to be

---

33 Of course reasonable investors do assess the credibility of management in making decisions, and willingness to rely no doubt varies from issuer to issuer depending on its reputation for candor. The stock price drop that ensues upon discovery of fraud is partly the product of learning the truth about the company's situation, partly the product of loss of credibility.

35 A very clear statement of this is in Lipton v. Documation Inc., 734 F.2d 740, 748 (11th Cir. 1984), where the court says "[t]he theory actually facilitates Congress' intent . . . by enabling a purchaser to rely on an expectation that the securities markets are free from fraud" (emphasis added). This explanation from *Lipton* is cited in *Basic* (with the specific page reference) but not quoted. 485 U.S. at 246; it was quoted in the SEC's amicus brief, which presumably led to the citation.

36 See *Richard Posner, Economic Analysis of the Law* 111-14,483 (7th ed. 2007). The point, of course, is that transactional efficiency is enhanced by creating a right to rely in the absence of affirmative reasons to doubt the factual representations of the maker, rather than force the other party to investigate their accuracy.
following the legislative word as opposed to promoting the legislative philosophy.

Second, and crucial to what follows, what does this version of presumed reliance have to do with market efficiency? The references come in the middle of a discussion of efficiency, so the Court obviously thinks that there is a connection (as did the SEC in its *amicus* brief, from which the "crooked crap game" quote comes). But market efficiency is a hypothesis about one or both of two things, the fundamental rationality of market valuation and the speed of adjustment to new information. The latter (informational efficiency) is what finance studies had largely shown, that is, that stock prices react very quickly to new information and show no bias or drift thereafter. To be sure, if prices adjust rapidly to impound new information then fraud will quickly distort prices if market professionals are deceived. So the fact of market efficiency would be a sufficient reason why an investor relying on market price integrity would be harmed.

But not a necessary reason, because fraud can and does distort prevailing prices even when adjustment is not delayed or incomplete. All we need is reason to believe that there is some causal linkage between the misrepresentation and prevailing prices that investors are using as reference points for their trading decisions. That is hardly a rigorous standard, and could be justified without any reference to sophisticated financial economics. In a footnote, the opinion says precisely this: "For purposes of accepting the presumption of reliance in this case, we need only believe that market professionals generally consider most publicly announced material statements about companies, thereby affecting stock market prices." It could have gone even further, because there are many ways even in the absence of professional analysts that information can affect posted prices.

The final portion of the Court's reliance discussion is about rebutting the presumption. Justice Blackmun gives three examples where traders might be disqualified. The first is where the market has in fact not been deceived, e.g., because market professionals knew the truth or considered the statements non-credible. Plainly, showing market

Goshen & Parchamovsky, supra, at 768-70.
38 485 U.S. at 246 n.24.
39 Id. at 248-49.
impact is plaintiff's burden on the merits but it is unclear why this should be a class certification issue: marketplace impact is an issue common to the class rather than anything having to do with individualized reliance or non-reliance. We will see in Part III how this has nonetheless come back into the case law with a vengeance. The second is closely related: if the market was fooled but learned the truth before a particular investor bought or sold, that investor cannot be said to rely. True, but the point just made applies again: this is a question of defining the class, but still not individualized proof. The third is the only plausible example -- the investor who had to buy or sell during the time period in question, and would have done regardless of what was known or not known about the issuer or its stock (for instance a shareholder forced by an antitrust decree to divest the stock within a certain amount of time). These three examples shed relatively little light on the Court's thinking, and have led to the widespread impression that if the class is certified, it will include all purchasers or sellers during the class period.

In the next three parts, we will look at how the presumption of reliance has played out in subsequent case law. Before turning to these questions, a word about Justice White's lengthy dissent, which was joined by Justice O'Connor. That dissent is best remembered today for its sarcastic expressions about stock market efficiency, accusing the plurality of writing a vision of financial economics into law worthy of the Medieval Scholastics -- that price always equals fair value -- well before the mechanics of market efficiency are adequately understood, and for the point that Congress wanted investors to rely on disclosure, not lazily assume that others are doing the work. But the dissent goes much beyond that. Justice White questions why there should ever be any recovery under Rule 10b-5 for open market fraud when the defendant

40 One interesting question is how strict application of this would affect an index fund that was required to buy or sell stock in the index to stay consistent with its investment characterization.

41 There are a number of cases that do seek to determine the kinds of purchasers who qualify for the presumption by reference to this rebuttal standard, e.g., options traders or short sellers, and the case law on this is mixed. See, e.g., In re Western Union Sec. Litig., 120 F.R.D. 629 (D.N.J. 1988).

42 This provoked a number of law and economics-oriented scholars, who considered White's dissent to be a misunderstanding of (and perhaps an attack on) modern finance theory. See, e.g., Daniel Fischel, Efficient Capital Markets, the Crash, and the Fraud on the Market Theory, 74 Cornell L. Rev. 907 (1989); William Carney, Limits of the Fraud on the Market Doctrine, 44 Bus. Law. 1259, 1277-78 (1989).
was not a purchaser or seller – seemingly a rejection of SEC v. Texas Gulf Sulphur,\(^\text{43}\) wherein the Second Circuit famously abandoned privity as a 10b-5 requirement and thereby laid the doctrinal groundwork for the fraud-on-the-market lawsuit.\(^\text{44}\) Justice White and Justice O'Connor were inclined to follow the business groups' insistence on simply shutting the door to expansive private securities litigation. We will have much more to say about the dissent in the discussion that follows.

This last point brings us back to the position of the SEC and the Solicitor General in Basic. Their \textit{amicus} brief filed in the spring of 1987 staunchly defended the presumption of reliance in the face of business' challenge, and put forth many of the efficient market hypothesis-based arguments that found their way almost verbatim into the majority opinion. As Justice White noticed, there was some irony in the Commission's embrace of market efficiency given that famous financial economists were at the time arguing that efficiency also proves that SEC-mandated disclosure is both unnecessary and counterproductive.\(^\text{45}\) Whether the Commission appreciated this threat to its historic legislative mission is not clear. Whatever the bureaucratic thinking, it bears emphasis that the fraud-on-the-market theory was at the time a free markets-driven idea, from which conservative SEC Commissioners and Reagan Administration lawyers might well have found reason to reject business' plea for protection. By all accounts, the most important intellectual justification for the presumption of reliance came from Daniel Fischel, who wrote about it in \textit{The Business Lawyer} in 1982,\(^\text{46}\) just before he joined the University of Chicago law school faculty. And his intellectual partner, Frank Easterbrook -- who handled securities cases in the Solicitor General's office before going to Chicago in the early 80's\(^\text{47}\) -- joined him in the applause, both in writings and, after his

\(^{43}\) 401 F.2d 833 (2d Cir. 1968)(en banc), cert. denied, 394 U.S. 976 (1969).
\(^{44}\) See 485 U.S. at 261, quoting the American Corporate Counsel Association amicus brief.
\(^{45}\) 485 U.S. at 259.
\(^{46}\) See Daniel Fischel, \textit{Use of Modern Finance Theory in Securities Fraud Cases Involving Actively Traded Securities}, 38 Bus. Law. 1 (1982). Fischel applauded the result in Basic, even though he did not necessarily concur in the Court's opinion. See Fischel, supra.
\(^{47}\) Easterbrook was the principal author of the Justice Department's brief in Chiarella v. United States, 445 U.S. 222 (1980), and the creator of what later came to be known as the misappropriation theory for insider trading liability.
appointment to the Seventh Circuit, from the bench. In this light, the
government's position wasn't a liberal outlier in 1987 but instead very
much in the mainstream of conservative law and economics thinking,
which hadn't yet assumed the more thoroughly jaundiced perspective on
the value of private litigation that emerged shortly after Basic in the
writings of influential scholars like Jon Macey and Geoff Miller, Paul
Mahoney, and Roberta Romano.

This is an important part of our story because to Easterbrook and
Fischel, at least, market efficiency was the *sine qua non* of the fraud-on-
the-market theory. They elide the reliance requirement because
individualized reliance is trivial in the context of market efficiency. The
law should protect markets; markets will then protect investors. That
approach requires causation only. The source of confusion, then, is the
Court's use of this idea as an organizing principle while at the same time
insisting that reliance must be an essential element of the cause of action.

Of the many consequences of this attempt, one should be stressed
at the outset. The primacy of reliance as a presumed fact rather than
either a fiction or an act of juristic grace strongly implied that each
investor has a *right* to individualized compensation for the fraud, which
given the large-scale class certification contemplated by *Basic*,
guarantees massive liability exposure in such cases. That indeed came to
be. This troubled Easterbrook and Fischel as a conceptual matter; they
concluded in their first law review article together that such aggregate

---

48 See Flamm v. Eberstadt, 814 F.2d 1169 (7th Cir. 1987).
49 See Macey & Miller, supra.
52 Fischel is clear about this in his first article, where he says that "the concept of a presumption of reliance, therefore, is thus best abandoned. The logic of the fraud on the market theory dictates that the reliance requirement as conventionally interpreted be discarded altogether." 38 Bus. Law. at 11. See also Eckstein v. Balcor Film Investors, 8 F.3d 1121, 1129 (7th Cir. 1993)(Easterbrook, J., reading *Basic* as if it does just that).
out-of-pocket damages will likely exceed the net social harm from the fraud because they ignore all the windfall gains by innocent marketplace traders who happen to be on the right side of buying or selling at a distorted price. Ultimately, however, they decided that the aggregate damages approach was nonetheless reasonably efficient.\textsuperscript{53} The next round of critical scholars was not at all persuaded by this view,\textsuperscript{54} however, and today, concerns that the tort-style approach to damages in open market fraud cases systematically overcompensates are common in the legal literature. When this point was joined with the recognition that investors largely self-fund this compensatory regime (i.e., that it really is an expensive form of investor insurance), cause for concern grew.\textsuperscript{55}

Had \textit{Basic} abandoned or softened the insistence on reliance-in-fact, other possible directions would have opened up -- recognizing that the goal of full class compensation might be excessive or unnecessary, which could lead to different ways of thinking about damages.\textsuperscript{56} An alternative, for example, might be to somehow limit out-of-pocket damages and/or seek more recovery from individual wrongdoers rather than the issuer itself.\textsuperscript{57} That, in turn, might lead us to see that class recovery makes more sense as a deterrence mechanism than a compensatory device, which would bolster the intuition that a stringent approach to reliance, causation or class certification is unnecessary.

\textsuperscript{53} See Frank Easterbrook & Daniel Fischel, \textit{Optimal Damages in Securities Cases}, 62 U. Chi. L. Rev. 611 (1985). Easterbrook and Fischel rightly note that damages include a variety of externalities (misallocation of economic resources, etc.) so that the right level is not simply the net of losses and windfalls or the benefit to the defendants.

\textsuperscript{54} See, e.g., Mahoney, supra.

\textsuperscript{56} Merritt Fox points out that the kind of reliance described in \textit{Basic} is so far removed from traditional "fraud in the inducement" that it doesn't properly deserve the label transaction causation. Merritt B. Fox, \textit{Demystifying Causation in Fraud on the Market Actions}, 60 Bus. Law. 507, 516 (2005). Once the Court kept to the reliance approach, it sowed seeds of further confusion, including inviting the loss causation mess that we will discuss in Part III infra.

Instead, as we are about to see, the law headed in precisely the opposite direction.

II. BASIC AND MARKET EFFICIENCY: POLYMEDICA

Basic says that plaintiffs must show some degree of market efficiency in order to gain the presumption of reliance, but says little about how to demonstrate this or how much efficiency is required apart from that footnote reference to "some" following by market professionals, which suggests a fairly easily-met efficiency threshold. A commentator who had surveyed the fraud-on-the-market cases before Basic noted that market efficiency was often mentioned but rarely rigorously applied, and so took in trading on nearly any well-organized marketplace.58

But once defendants had failed to persuade the Supreme Court to reject the presumption of reliance generally, their tactics shifted to arguing, at least with respect to non-blue chip issuers, that the market for that particular issuer was not sufficiently efficient. This forced the lower courts to confront that question explicitly and look for objective markers on which certification decisions could be made. After all, Basic had made a big deal of efficiency (and Justice White's dissent insisted that it was fundamental to the majority's conclusion). Basic's obfuscation about the role of efficiency sent the courts off on a long journey without a particularly good compass.

Predictably, courts began collecting a list of factors that they might use in making efficiency decisions: the best-known list, still, comes from a district court decision decided shortly after Basic, Cammer v. Bloom.59 Cammer lists five factors: the weekly trading volume; number of analysts following the company; number of market makers and arbitrageurs; status as an S-3 filer for SEC disclosure purposes; and responsiveness of the market price to new information. The jumble is evident. The last factor, usually measured by reference to speed of adjustment, is the standard test for informational efficiency, and would seem to be sufficient to address the issue. The first three are plausible predictors for relatively high speed of adjustment (and probably correlate

58 See Black, supra, at 937.
highly with each other, producing some redundancy). Filer status is based on the idea that S-3 status reflects the SEC's judgment about efficiency, which is only loosely true. As with most multi-factor lists, Cammer is unclear what is to be done except examine the factors in order. It invited an ad hoc approach informed by expert testimony, but in fact largely unconstrained.

The judicial muddle should hardly be surprising, because informational efficiency is not a binary, yes-no question. Perfect efficiency is just a theoretical ideal; measurement tools compare actual adjustment of a particular piece of information to the ideal. One can generalize about different markets and different issuers to find support for the common sense intuition that the larger the trading volume, the larger the number of shareholders, the larger the professional following, etc., the quicker the adjustment one is likely to observe on average.

Hence the appeal of Cammer's first three factors. But wading into the mind-numbing data defendants (and thus plaintiffs as well) often put forward in their expert reports creates the illusion that there is a bright-line distinction among different issuers to be discovered, forgetting that we are still not sure how or why that distinction matters.

1. Polymedica

The most thorough appellate court discussion of how to approach efficiency at the class certification stage is In re Polymedica Corp.

---

62 One of the earliest empirical studies to address the definition of efficiency in fraud on the market cases, still often cited, concluded that only two of the factors (number of analysts and volume of trading) are particularly probative. See Brad Barber et al., The Fraud on the Market Theory and the Indicators of Common Stocks' Efficiency, 19 J. Corp. L. 285 (1994); see also Victor Bernard et al., Challenges to the Efficient Market Hypothesis: Limits to the Applicability of the Fraud on the Market Theory, 73 Neb. L. Rev. 781 (1994).
Securities Litigation. Polymedica was a Nasdaq company, but not a blue-chip stock. In certifying the class, the district judge – Robert Keeton, hardly an amateur at thinking through tort-type cases – refused to consider defendants' detailed analysis of potential inefficiencies in Polymedica's market because, relying on Basic's footnote dictum, he did not think the efficiency analysis at the class certification stage should be overly demanding, simply enough to be reasonably confident of a likely causal connection between public information and the issuer's stock price. He rejected defendant's claim that market efficiency as financial economists understand that term had to be established.

The First Circuit reversed, starting its lengthy inquiry by acknowledging that the case law had not yet clearly explained the role of efficiency in class certification decisions, and hence went back to Basic to find the right answer. What the court decided, however, was that Basic was incoherent. It took note of the footnote language and conceded that it fully supported the Judge Keeton's minimalist approach. But the court decided that the footnote was inconsistent with so much of the rest of the opinion, as well as statements in pre-Basic case law suggesting that efficiency was a serious and important inquiry. Thus it dug more deeply to find the link. The court's conclusion is stated clearly enough: to certify the class, the district judge must make a reasoned determination that the market for the issuer's stock "is one in which the market price of the stock fully reflects all publicly available information." Not partly reflects, nor fully reflects some, but fully reflects all. The First Circuit said that this does require a detailed look at all measures of informational efficiency as financial economists use the term, which the district court had not done.

At this point, the court tries to explain why, but never really succeeds because it gets caught up in the same confusion as Basic. Early

---

63 432 F.3d 1 (1st Cir. 2005). At roughly the same time, a number of other circuit courts similarly came to the conclusion that there should be rigorous district court scrutiny of efficiency claims, and rigorous appellate court review of class certifications where efficiency is in question. See also, e.g., Gariety v. Grant Thornton, 368 F.3d 356 (4th Cir. 2004); Unger v. Amedisys Inc., 401 F.3d 316 (5th Cir. 2005); see generally Douglas C. Conroy & Johanna S. Wilson, Class Actions -- Evening the Playing Field: Stress-testing the Efficient Market Hypothesis, 4 Corp. Accountability Rep. (BNA), no. 26 (June 30, 2006).

65 432 F.3d at 10.

66 Id. at 14 (emphasis in original).
on in the analysis, it seems inclined to invoke fundamental value efficiency as crucial, but quickly backs off of that (although it says that district courts might want to consider evidence on accuracy of adjustment even though it will not necessarily be determinative).\textsuperscript{67} Informational efficiency is what is important.\textsuperscript{68} But what does speed of adjustment have to do with reliance on stock price integrity? The court's answer is that speed of adjustment creates the confidence that the particular piece of misinformation on which plaintiffs have based their lawsuit has in fact been impounded into, and thus distorted, the market price.

The logical flaw here should be obvious. High speed of adjustment does indeed bolster that confidence, and thus can be highly probative. But what would less-than-high speed of adjustment prove? Remember that tests for adjustment seek to determine that time at which the stock price has ceased responding to the new information in a biased fashion. A few hours or a day would presumably show high speed. But suppose it took a few days or even weeks? The price is still distorted, even if it drifts for a while.

\textit{Polymedica} never explains why if the question is simply whether the price was distorted in the first place, the class certification decision should be anything more than educated guess that the fairly basic market conditions for information to influence prices are met. Judge Keeton had done just that. And left open by the First Circuit are many questions, not the least of which is how fast is fast, given that no adjustment is magically instantaneous. Nor is it clear how close the court's inquiry comes to assessing the speed of adjustment of the \textit{particular} piece of information at issue in the lawsuit as part of the class certification decision, which is the question considered in Part III. One of the points about market efficiency the \textit{Polymedica} court never thought much about is the finding that different kinds of information are likely impounded at different rates of speed, even for the same issuer. Not surprisingly, dramatic, easy-to-understand information takes less time to impound than more subtle or confusing information about which there may be substantial disagreement. One of the most common types of material disclosures -- an earnings surprise -- actually takes a while to be fully

\begin{footnotesize}
\begin{itemize}
\item \textsuperscript{67} In a companion case, \textit{In re Xcelera.com Sec. Litig.}, 430 F.3d 503 (1st Cir. 2005), the court expressly rejected the requirement that a court find that the market "accurately" prices the stock -- i.e., is devoid of noise -- in order to certify. See note --- infra.
\item \textsuperscript{68} 432 F.3d. at 14-17.
\end{itemize}
\end{footnotesize}
impounded, even for large-cap stocks.\(^{69}\) The inquiry the court demands can turn out to be a morass.

A close reading of *Polymedica* and many other fraud-on-the-market cases suggests that a useful way to pose the question is in terms of “justifiable” reliance. Here, some pre-*Basic* case law is instructive. Shortly after lower courts started adopting a presumption of indirect reliance based on market price distortion in the 1970’s, they started considering how far the idea could be stretched in the absence of an organized market. In a series of cases, of which *Shores v. Sklar\(^ {70}\)* is the best known, a few courts of appeals took the logic fairly far. For instance, why not permit a presumption of reliance in the unregistered public offering setting (e.g. municipal bonds, as in *Shores*) because the issuer may have deceived its investment bankers, who then set the offering price too high, thereby harming buyers who took that price. Or lies to the SEC, which may have caused it to permit a transaction to go forward that would not have otherwise.\(^ {71}\)

If "but for" causation of mispricing is the question, then this logic might work. But shortly after these cases took root, there was a counter-reaction that imposed severe limits and smothered their growth. For the most part, this reversal did not contest the logic of causation or indirect reliance so much as question that any investor who so relied in these settings was at all reasonable in doing so. These cases distinguish organized markets where the forces of arbitrage and informed trading justify investors who forego diligence and research from settings like public offerings where there are no such unbiased forces, just underwriters and dealers with incentives to make deals happen.\(^ {72}\) This

\(^{70}\) 647 F.2d 462 (5th Cir. 1981)(en banc), cert. denied, 459 U.S. 1102 (1982). The essence of this approach is that the fraud created the market, i.e., allowed unmarketable securities to nonetheless come to market. For a discussion and criticism based heavily on justifiable reliance, see Carney, supra.

\(^{71}\) See T.J. Rainey & Sons v. Fort Cobb Irrigation Fuel Authority, 717 F.2d 1339 (10th Cir. 1983).

\(^{72}\) The key case was Ross v. Bank South N.A., 885 F.2d 723 (11th Cir. 1989), decided shortly after *Basic*. The court did not overrule *Shores*, but did limit it severely. In a concurring opinion emphasizing the reasonableness point, Judge Tjoftt said flatly that *Shores* was wrongly decided. Id. at 739. See also Eckstein v. Balcor Film Investors, 8 F.3d 1121 (7th Cir. 1993), cert. denied, 510 U.S. 1073 (1994); Joseph v. Wiles, 223 F.3d 1155 (10th Cir. 2000); In re Initial Public Offering Securities Litigation, 471 F.3d 24 (2d Cir. 2006)(IPO market inefficiency as one reason not to certify).
tied into a line of authority under Rule 10b-5 that denied recovery to investors whose reliance was overly gullible.73

Polymedica invokes this kind of reasoning. The court says, for instance, that investors are justified in assuming that informationally efficient markets have integrity.74 To this we have to ask the same question as in Part I: what is it about speed of adjustment that could justify anyone in assuming no fraud? There is no good answer, which is what led us to see that what Basic is doing is creating an entitlement to such reliance, rather than just describing it as a fact. But once we accept the normative dimension to this exercise, we can ask questions of the sort that provoked the counter-attack to Shores and its progeny: why should anyone be relying (rather than doing some basic diligence) in the absence of fairly compelling protective features built into the market, for which speed of adjustment might be a good proxy? This taps into one of Justice White's dissenting points in Basic. We want investors to act with some diligence, and blind reliance shouldn't be rewarded. Investors who buy or sell thinly traded stocks should not be assuming much of anything.

I suspect that this inchoate idea motivates Polymedica – there are limits to how far we would want to go in creating an entitlement to rely on price in settings of palpable inefficiency. But it is hard to see why the detailed ex post inquiry into informational efficiency that the First Circuit insists on is a particularly good way to draw this line. Note how disconnected the Cammer factors are from what a typical investor actually might (or even could) think about ex ante in deciding whether a stock's price has integrity. Again, we come back to what speed of adjustment can tell us. Even if we believe that some markets are too thin to justify any uninformed reliance, the category of markets that are "thick enough" is presumably fairly large.75

74 432 F.3d at 16.
75 Easterbrook suggested as much in Eckstein v. Balcor Film Investors, 8 F.3d 1121, 1130 (7th Cir. 1993) when he said that “prices of even poorly followed stocks change in response to news, including statements by issuers, and these changes may be better indicators of causation than litigants’ self-serving statements about what they relied on and about what they would have paid (or whether they would have bought at all) had the issuer said something different.” He suggested that the line is crossed when this approach to causation “peters out” sufficiently that “the litigation process offers
In sending inexperienced district judges off on mind-numbing investigations of adjustment variations often measured in minutes rather than weeks, cases like Polymedica invites no-certification decisions unrelated to any meaningful assessment of justifiable reliance. And that is precisely what seems to happen when courts enter the efficiency thicket to resolve battles among the experts. The case law is inconsistent and largely self-referential: X number of market-makers is not enough but Y is, or Z days speed of adjustment is too slow, largely because some other court said so.\footnote{See note --- supra.} The bar can be set mindlessly high. An example of what can happen is a Fifth Circuit decision, \textit{Bell v. Ascendent Solutions Inc.},\footnote{422 F.2d 307 (5th Cir. 2005). To be fair, \textit{Ascendant}'s main grounds for affirming is that the plaintiffs' expert report was unpersuasive in its methodology, and that plaintiffs left out key pieces of information from their argument. But given the prima facie case for efficiency, the rigor of what it demands is still worth noting.} where the court affirmed a refusal to certify a Nasdaq-traded stock with some twenty or so marketmakers and high trading volume in the context of a case where immediately after a surprise disclosure of bad news, the stock price fell by some 30%. Those facts certainly suggest a market where fraud can distort price, and no obvious reason why investors should not be entitled to rely. But there is no such thing as a perfectly efficient market, and so it becomes easy for a court to miss the forest for the trees by accepting too readily the defendants' statistical evidence of imperfection as reason not to certify.

2. \textit{Imperfect Inefficiency}

For large-cap stocks, there is seldom any debate over whether the market is efficient enough: efficiency is assumed. That does lead immediately to certification, however, because as we shall explore in Part III, there may still be issues of market impact and loss causation to address. What is worth noting here is that many courts that take up these issues simply then shut their eyes to any further empirical questions regarding actual informational efficiency, and simply assume near-perfect efficiency. This is the flip side of what \textit{Polymedica} does -- efficiency remains a binary question, and just as a no answer takes away the reliance interest entirely, a yes answer removes all doubt.
A Third Circuit case, *In re Merck & Co. Securities Litigation*, is instructive here. Merck allegedly misstated the revenues associated with a major subsidiary, Medco. It eventually corrected this in an obscure way in an S-1 securities registration filed for review by the SEC. But the presentation left the calculation of the impact to the reader, who would have to parse through various bits of data elsewhere in the filing to even make an estimate of the bottom line effects. There was no demonstrable market impact around the time of this filing. Some time later, however, the Wall Street Journal ran a story about it, with the reporter doing a rough calculation, and Merck's market price dropped significantly when that story appeared. The Third Circuit found that the market's initial lack of reaction established immateriality as a matter of law (a subject we will come back to in Part IV).

Naturally, plaintiffs wanted to fight this by arguing that the market had simply been slow in discovering the buried facts. But the Third Circuit wanted no part of such an argument. After declaring its faithful "commitment" to the efficient market hypothesis in fraud-on-the-market cases, it said that once efficiency is established, speed of adjustment is presumed as a matter of law: plaintiffs' claim, it said, "overlooks that our Court has [already] resolved how 'quickly and completely' public information is absorbed into a firm's stock price. We have decided that this absorption occurs 'in the period immediately following disclosure.'" It then put plaintiffs in a tight bind. Were they to successfully challenge that determination on grounds that the market was slow in responding to the news because of its obscurity, the court said, it would simply demonstrate the inefficiency of the market for Merck stock, and be grounds for denial of certification under *Basic*.

Because it is hard to imagine any stock more likely traded in an efficient market than Merck, this threat is rather striking. The questions here are two-fold: first, whether under our current state of knowledge of finance it is at all plausible that such a delayed reaction could occur in a

---

79 432 F.3d at 269, quoting Oran v. Stafford, 226 F.3d 275, 282 (3d Cir. 2000). The court also said "[a]n efficient market for good news is an efficient market for bad news," paying no attention to evidence that there may be precisely such an asymmetry. See Harrison Hong et al., *Bad News Travels Slowly: Size, Analyst Coverage and the Profitability of Momentum Strategies*, 55 J. Fin. 265 (2000).
relatively efficient market; and second, what follows if it is? This bears on Justice White’s prophecy when he warned against adopting a theory based on not-yet-proven financial economics.

Doubts about the strength and pervasiveness of market efficiency are much greater today than they were in the mid-1980’s. I have written at length about the legal implications of this, as have many others. As a technical matter, to be sure, these doubts are easy to misconstrue. Because market efficiency is a theoretical ideal, even statistically significant deviations from its predictions that mean much to financial economists would mean much less to a layman. Although researchers debate whether some observed anomalies are such that profitable trading strategies can be devised from them, any such strategies are usually only marginally profitable, short-lived or both. The growth of hedge funds is evidence that there is profit to be made in exploiting inefficiencies, but only for those with immense sophistication.

80 For thorough studies of this question, see Frederick Dunbar & Dana Heller, Fraud on the Market Meets Behavioral Finance, 31 Del. J. Corp. L. 455 (2006); William O. Fisher, Does the Efficient Market Theory Help Us Do Justice in a Time of Madness?, 54 Emory L.J. 843 (2005); Ferrillo et al., supra; see also Alon Brav & J.B. Heaton, Market Indeterminacy, 28 J. Corp. L. 517, 535-36 (2003; Ribstein, supra.

81 For two very recent surveys summarizing much of this research, see Harrison Hong & Jeremy Stein, Disagreement and the Stock Market, 21 J. Econ. Perspectives 109 (2007); Malcolm Baker & Jeffrey Wurgler, Investor Sentiment and the Stock Market, 21 J. Econ. Perspectives 129 (2007). On the degree of doubt and disagreement about efficiency among finance and economics professors, see Ivo Welch, Views of Financial Economists on the Equity Premium and on Professional Controversies, 73 J. Bus. 501 (2000); James S. Doran et al., Market Efficiency and Its Importance to Individual Investors -- Surveying the Experts, available at http://ssrn.com/abstract=1006237 (noting that not only are economists in disagreement about the degree of efficiency, but more strongly, do not act as if the market is efficient in their own investment activities).

82 See Donald C. Langevoort, Taming the Animal Spirits of the Stock Markets: A Behavioral Approach to Securities Regulation, 97 Nw. U. L. Rev. 135 (2002); Langevoort, Theories, supra.

83 Strangely, Polymedica used as one of its main citation source on market efficiency an article by Lynn Stout that is mainly about market inefficiency. See Lynn Stout, The Mechanisms of Market Inefficiency: An Introduction to the New Finance, 28 J. Corp. L. 635 (2003).

84 See Burton Malkiel, The Efficient Market Hypothesis and its Critics, 17 J. Econ. Perspectives 59 (2003). Fischel emphasized this in arguing that doubts about efficiency should not undermine the Basic presumption. See Fischel, supra.
and resources, and perhaps with diminishing returns and greater risk as more entrants make the required effort.

Nonetheless, the contemporary literature suggests that even for widely-traded stocks, significant deviations from the efficiency ideal are quite possible. There is plenty of evidence, for example, of momentum and drift -- that is, abnormal returns that persist for relatively long periods of time, even for larger issuers. When sentiment or noise causes an overreaction to some kinds of news (or pseudo-news) or an underreaction to other news (perhaps because pseudo-information crowds out what is fundamentally important because of limited attention capacity\(^{85}\)) we see evidence of both fundamental and informational inefficiency. There is evidence that even professional investors and analysts sometimes pay insufficient attention to buried facts, and react only – albeit swiftly – when issues are made more salient.\(^{86}\) A recent study of corrective disclosures of financial information, for example, demonstrated dramatic differences in marketplace reaction depending on how prominently the issuer publicized the correction.\(^{87}\) For this reason, while we still should be skeptical of plaintiffs claim in \textit{Merck} that the market simply missed the significance of the corrective disclosure in the filed S-1, financial economics would not rule out this possibility entirely. Given the abnormally large drop in Merck's price when the \textit{Journal} published its report, it probably was worth a harder look at what actually happened and why.\(^{88}\)

Suppose that plaintiffs were able to put forth a sufficiently persuasive case (e.g., through analyst testimony) that the market had simply missed the importance of what was buried in the S-1 filing. I

\(^{88}\) For a discussion, see Padfield, supra, at 954-57.
think Merck is wrong in suggesting that this should defeat plaintiff’s entitlement to the presumption of reliance. As discussed earlier with respect to Polymedica, the question simply goes back to what use we are actually making of market efficiency. If, Basic’s presumption is essentially an entitlement to rely on the market price as undistorted by fraud, it is hard to see why investors should lose that entitlement simply because of some market imperfection. To the contrary, these kinds of imperfections would seem to strengthen, not weaken, the need for additional investor protection.89 If one cannot rely on the integrity of the market for Merck stock, then no stock price is reliable.

Polymedica refers to these contemporary doubts about efficiency,90 but concludes that they mainly challenge fundamental but not informational efficiency, and the court makes clear that all it is insisting on is the latter. A companion case, In re Xcelera.com Securities Litigation,91 confirms this, rejecting defendants’ effort to invoke the inefficiency literature to argue that Xcelera.com’s market was noisy and moody. This is a bit too facile, however. As Fred Dunbar and Dana Heller have emphasized,92 this literature indicates that material information is sometimes ignored, and immaterial information sometimes weighted heavily. What is impounded into price, at whatever speed, can be a mix of real factors and pseudo-factors, with no obvious way of knowing when reality will come to dominate. To the extent that cases like Polymedica are looking for evidence that the issuer’s market price reflects only value-relevant information,93 one cannot so easily ignore the doubts about informational efficiency that are now well-
established in the finance literature. But again -- if we were right earlier in our reading of Basic -- so what?\textsuperscript{94}

One notable judicial recognition of the inefficiency concern was in \textit{Bell v. Ascendant Solutions Inc},\textsuperscript{95} a Fifth Circuit case noted earlier. In rejecting class certification on efficiency grounds, the Fifth Circuit went through plaintiffs' various arguments for presuming efficiency, including the fact that four analysts covered Ascendant, although not throughout the class period. One reason given by the court for ignoring this was that sell-side analysts have been shown to be biased when self-interest is present, and here three of the analysts were affiliated with investment banking firms that underwrote Ascendant's IPO. They thus generate mispricing, not efficiency.\textsuperscript{96} There are two responses to this. One is that the court probably oversimplified what is known about the effects of analyst bias:\textsuperscript{97} although bias is observable in the finance literature, there are off-setting factors (including potential market adjustments for conflicts) that make it hard to show whether or how much affiliated analysts drive market prices away from fundamental value. The other is that this is clearly an emphasis on fundamental rather than informational

\textsuperscript{94} As noted earlier, a number of commentators have called for a complete reexamination of \textit{Basic} in light of this literature. This was rejected in Unger v. Amedisys Inc., 401 F.3d 316, 322 n.4 (5th Cir. 2005) as a job for Congress, not the lower courts. And it is worth noting that Congress spoke to this at least indirectly in the PSLRA, acting in response to concerns about marketplace overreaction to corrective disclosure without in any way altering \textit{Basic}'s presumption. See Langevoort, \textit{Animal Spirits}, supra, at 182-86; Jeffrey L. Oldham, \textit{Note: Taking Efficient Markets Out of the Fraud on the Market Doctrine After the Private Securities Litigation Reform Act}, 97 Nw. U. L. Rev. 995 (2003); Nathaniel Carden, \textit{Comment: Implications of the Private Securities Litigation Reform Act of 1995 for Judicial Presumptions of Market Efficiency}, 65 U. Chi. L. Rev. 875 (1998). In the lower courts, then, the more likely response is to continue to narrow the definition of efficiency in class certification decisions. Thus, for instance, Dunbar and Heller suggest adding to the \textit{Cammer} factors inquiry into the level of short selling ability for the stock in question, because short-sale restrictions are one common reason to doubt the ability of arbitrage to cleanse the market of behavioral biases. See Dunbar & Heller, supra, at 517-19.

\textsuperscript{95} 422 F.3d 307 (5th Cir. 2005).

\textsuperscript{96} Id. at 315 n.17, citing Fisher, supra.

efficiency: there is no question in the finance literature that analyst coverage correlates positively with speed of adjustment. Here, again, we see a court invoking efficiency/inefficiency evidence without clear articulation of what the point proves.

3. Restatement

Basic is surely to blame for its own confusion about the role of efficiency in the presumption of reliance. But the Court’s opinion makes sense if we see it as creating an entitlement to rely on market price integrity even though there is no good reason for any investor simply to assume the absence of fraud. That, as said earlier, is an act of juristic grace rather than recognition of any pre-existing right. Basic thus allows recovery without a showing of actual reliance on the fraud that is justifiable so long as the market is sufficiently well-organized that we have reason to believe that fraud is likely to distort the price. The limit on this should come only in situations (like Shores v. Sklar) where the institutional price-setting mechanism is so weak that reliance on price integrity is manifestly unreasonable. It takes a high level of inefficiency for that to be the case. If so, then Judge Keeton got the approach right in his district court opinion in Polymedica, and the First Circuit was wrong to reverse him. For the same reason, cases like Merck are completely off base in suggesting that finding any significant market imperfection -- of the sort that might be found with respect to any company's stock -- would automatically defeat the presumption.

While this sounds extremely plaintiff-friendly, remember that there is still much more to come. Eventually, whether on the merits or as a matter of class certification, plaintiffs will have to show that the fraud did in fact distort the market price. As we are about to see, differing visions of market efficiency are very much at work here as well, and plaintiffs’ burden can become very heavy. We are not yet out of the thicket.

---

98 See Barber et al., supra.
III. Basic, Market Impact and Loss Causation

As we have seen, part of the interesting intellectual history behind Basic and the fraud-on-the-market presumption was the embrace that the presumption received early on from conservative academics and judges, particularly Easterbrook and Fischel. This was not an impulsive love affair with aggressive private securities litigation. Instead, it was part of a larger agenda, designed to substitute a market test for the subjective (and often too plaintiff-friendly, in their view) evaluation of materiality. True believers in market efficiency, they were sure that the number of lawsuits would go down rather than up if courts also insisted on a rigorous showing of market impact, because markets are extremely hard to fool. They said, however, that if such an impact can be demonstrated, plaintiffs have a good claim to recovery, with damages measured and limited by reference to the impact. The assumption was that scientific expert testimony in the form of an event study would reliably establish impact or not, and Fischel later co-founded Lexicon to assure that the requisite expertise was available.

To the extent that they believed that the science was determinate, they were wrong: famously, econometric studies on both materiality and damages can produce wildly divergent estimates and bona fide factual disputes. In this sense, Fischel's predictions notwithstanding, Basic was a boon to plaintiffs, which encouraged the rapid growth in fraud-on-the-market suits after 1988 -- the number of filings had already tripled by 1991, and continued to rise dramatically over the next fifteen years.

Two comments on the connection between this and what was just discussed in Part II are in order. First, as Macey, Miller, Mitchell and Netter pointed out shortly after Basic, rigorous insistence on a

---

100 Here again, Fischel is clear: "Because the focal issue of every case will be whether there has been any effect on the market price of the firm's securities, the increased certainty resulting from this objective determination will reduce the amount of litigation." Fischel, supra, at 16. A classic expression of this approach, cited in Basic, is Roger Dennis, Materiality and the Efficient Capital Market Model: A Recipe for the Total Mix, 25 Wm. & Mary L. Rev. 373 (1984).

102 See Mahoney, supra.

103 See note --- supra.
showing of market impact would seem to obviate the need to also show market efficiency if what we care about is simply stock price integrity. Event study methodology works acceptably well even for thinly traded stocks, although the higher volatility associated with such stocks does require a larger abnormal return in order to be confident that the observed impact of the alleged misrepresentation was not simply by chance. Contrary to Polymedica, courts can be fairly relaxed about efficiency in class certification decisions without losing control over this aspect of the case.

On the other hand, the behavioral finance and market inefficiency literature plainly becomes more troubling here. If we assume that markets often over or under-react to news (and pseudo-news) and sometimes develop troublesome bubbles where price strays from intrinsic value, then the simple statistical showing of an impact cannot so easily be treated as a precise measure of either the omitted information or defendant's responsibility. In other words, the event study no longer offers a clean assessment of the intrinsic value of the fraud because noise and sentiment can influence price as well, and hence the econometrician's ability to discipline the litigation process diminishes.104

The connection between Basic's teachings and inquiries into market impact therefore deserves careful thought. Market impact analysis takes two related forms – first, the showing that the market was distorted by the fraud; second, that the emergence of the truth, corrective disclosure, caused a loss to some or all investors. The former, as just noted, is what Basic focused on as a predicate for the presumption of reliance. The latter, loss causation, is conceptually separate. Typically, however, litigants have used measures of market decline after corrective disclosure as the best available evidence of the extent of the original fraud-induced price distortion and hence these two issues are often treated as if the same.105

104 See Dunbar & Heller, supra. To some extent at least, it also calls into question the precision of the event study itself, which often makes efficiency-driven assumptions in drawing the baseline against which observed returns are measured. See Brav & Heaton, supra, at 536-37.

105 E.g., Robert Thompson, “Simplicity and Certainty” in the Measure of Recovery Under Rule 10b-5, 51 Bus. Law. 1177, 1181-85 (1996); Cornell & Morgan, supra. This is particularly apt when what plaintiffs allege is an omission rather than affirmative lie: the omission will not necessarily lead to an identifiable market move – rather, plaintiffs’ claim is that the market would have adjusted had the truth been told.
Well after Basic, the Supreme Court took on separate the question of loss causation in Dura Pharmaceuticals,\(^{106}\) a case dealing with issues of pleading and proof, not class certification. Other courts, however -- most notably, the Fifth Circuit in Oscar Private Equity Investments v. Allegiance Telecom Inc.\(^{107}\) -- have turned loss causation into a class certification question, finding implicit permission to do so in both Basic and Dura. I find Allegiance unpersuasive, for reasons we will come to shortly. However, first we need to take a closer look at Dura.\(^{108}\)

A. Dura Pharmaceuticals

Dura deals what plaintiffs need to plead and prove regarding whether there was a subsequent loss in value of the stock that is attributable to the fraud. It is easy to become confused by loss causation, wherein securities litigation confronts many of the same "proximate cause" problems that have vexed generations of judges, lawyers and law students in torts and criminal law generally. Here, in many ways, Rule 10b-5 meets Palsgraf.\(^{109}\) For example, suppose a pharmaceutical company knowingly misrepresents its estimates of revenues and earnings from sales of a particular drug. A few months later, a safety defect is unexpectedly discovered and the drug is pulled from the market, which causes an immediate and severe stock price drop. Somehow, the lie is also uncovered and revealed. To the extent that the stock price drop was caused by the safety defect (and assuming that had nothing to do with the lie), it's easy to see the argument that the lie caused no loss -- the intervening event caused the entire injury, which would have occurred

---

\(^{107}\) 487 F.3d 261 (5th Cir. 2007).

whether or not there was a lie. Thus there is nothing for investors to recover, even if all the other elements of a cause of action under Rule 10b-5 are satisfied.

The standard measure of damages in open market fraud cases has long been the so-called "out of pocket" loss measure. That is the difference for each purchaser or seller between the transaction price and the hypothetical value the security would have had that same day had the truth been told. This approach ignores all post-transaction events (although as noted earlier, plaintiffs have typically sought to construct the hypothetical value by reference to what later happened to the stock price when the truth came out). All that is measured is price distortion, Basic's focal point. At first glance, loss causation would seem irrelevant under this approach, at least as long as the trial judge prevents plaintiffs from sneaking in unrelated stock price declines as evidence of the price distortion.

In Dura, the Ninth Circuit followed this out-of-pocket reasoning closely in holding that plaintiffs satisfy their pleading burden simply by alleging price distortion. A unanimous Supreme Court reversed, however, with Justice Breyer writing the opinion. The Court’s "logical" starting point is that there is nothing automatic about loss simply as a result of inflated price because "the inflated purchase payment is offset by ownership of a share that at that instant possesses equivalent value." In other words, if the stock is resold before the truth comes out, there is no injury. That is certainly right, but is easily dealt with for those particular "in and out" traders by offsetting the hypothetical loss at the time of the transaction with the windfall that comes from selling at an inflated price. The Ninth Circuit had dealt with this successfully for years prior to Dura.

The bigger issue is where there is an intervening or supervening event that also causes investor injury, to which the out-of-pocket measure pays no attention. The Court insisted that it do so. One reason for this was that Congress had imposed an explicit loss causation requirement in 10b-5 lawsuits in 1995, with fraud-on-the-market suits clearly in mind. Paying no attention seems inconsistent with whatever

Congress might have been thinking. But textualism is not what the Court emphasized: instead, the reasoning was quite purposive. It twice quoted Justice White's dissent in Basic in emphasizing that 10b-5 litigation is not supposed to provide investor insurance, and indicated that compensating for losses that would have happened anyway would be just that.

One has to be very careful in thinking through loss causation before playing the investor insurance card. Determining whether there might be some foreseeable relationship between the lie and the seemingly unrelated loss is often very hard. But even assuming an unrelated supervening event, can we be so sure that none of the stock price drop related to the fraud? If not, the issue is to disentangle the two separate causes of the price drop rather than assume there is no "fraud loss" at all. Moreover, as Judge Posner wrote in the seminal opinion on this subject in face-to-face cases (where most all the pre-Dura case law developed), there will be some instances where it is fair to say that but for the fraud, the investor would not have purchased the

---

114 Courts here have developed the test that asks whether a reasonable person at the time of the fraud could have foreseen this kind of injury as a result of the fraud, see AUSA, supra., or alternatively, whether the loss was caused by a materialization of the risk that was misrepresented or concealed. See Suez Equity Investors LP v. Toronto Dominion Bank, 250 F.3d 87 (2d Cir. 2001). The test has proved notoriously difficult to apply in practice, as illustrated by AUSA, where the three judges on the panel had three different answers to the foreseeability question.

115 A fascinating question, still unresolved by the courts, has to do with the stock price decline that reflects the issuers' loss of credibility upon discovery of the fraud. To take the example given earlier, even if the drug is permanently pulled from the market, isn't it likely that the revelation said something about management's honesty, so that the drop was the combination of the product recall and the revealed dirty linen? Presumably, most stock price declines that follow a surprise revelation of fraud reflect not only the truth with respect to the specific facts misrepresented or omitted, but also a readjustment in expectations regarding other matters on which management was previously thought credible. Should investors be able to recover for this downward readjustment as well? See Ferrell & Saha, supra ("collateral damage" not recoverable); Alexander, supra. My sense is that this is recoverable as within the foreseeable consequences attendant to revelation of the fraud. Cf. AUSA, supra (Winter, J., concurring: had the truth been told, plaintiffs would have realized management's lack of credibility, so that consequences of the dishonesty are within the zone of proximate cause).

stock at all -- rather than simply purchased it at a distorted price -- and so would not have suffered the later loss whatever its cause.117

*Dura* does little more than reject the price inflation approach; it says nothing about how courts are to deal with uncertainty about whether losses were attributable to the fraud or not, or whether there were losses in the first place. The two main proof problems are well known. First, what if there is no price drop at all upon corrective disclosure? That was the specific question in *Dura*. Although this might well signal that the market was never fooled in the first place, it could also be explained by pre-disclosure leaks or independent discovery of the truth, or the mixing in of good news with the acknowledgement of the truth. The very idea that markets wait for the formality of corrective disclosure to generate dramatic effects defies the teachings of market efficiency. Second, as just noted, what if there were multiple bits of bad news at the same time as the admission of the truth, so that although the stock price drop is perfectly visible, disentangling the multiple effects is impossible?118

Event studies do very well when there is a single event and a short time window to measure marketplace impact, but not all that well otherwise. Since *Dura*, courts have hardly been clear on the burden of uncertainty even at the pleading stage, but the case law tilts in defendants' favor.119

In contrast to *Basic*, the Court did not make much of an effort to lighten plaintiffs' burden though presumptions or other procedural devices, even

---

117 One example emphasized in the behavioral finance literature is the power of momentum: traders coming in precisely because they have observed a price rise and believe that it will continue. E.g., Hong & Stein, supra, at 120-22. Indeed, Posner's emphasis on excluding market wide trends was based on an efficient markets point: all securities have equivalent value on a risk-adjusted basis.

118 See Spindler, supra. There are possible approaches to this -- for instance, focusing on intra-day price moves. See FERRELL & SAHA, supra. A third issue that has gotten increasing attention is what happens if there are multiple allegedly fraudulent statements, for which certain defendants (e.g., investment banks) are only responsible for some, not all. How can we know what correction was attributable to those particular misstatements as opposed to others, if the truth about everything came to light at once. A variation on this, which has generated a good bit of litigation, deals with alleged fraud by investment analysts: how much of the price deflation can be attributed to them as opposed to other factors when the particular stock bubble (or entire industry bubble) bursts? See, e.g, Lintell v. Merrill Lynch, 396 F.3d 161 (2d Cir. 2005).

though it could easily have done so.\textsuperscript{120} As such, \textit{Dura}'s disinclination to move in that direction probably does say something about shifting attitudes toward private securities litigation in the last twenty years – an issue we will come back to shortly.

B. Allegiance

\textit{Allegiance} is the most recent of a cluster of Fifth Circuit decisions dealing with the question of what showing plaintiffs must make at the class certification stage on whether the fraud distorted the market in the first place.\textsuperscript{121} As we have seen, \textit{Basic} set this confusion in motion. Its dicta regarding what must be shown for purposes of creating the presumption of reliance does not require such a showing explicitly. But Rule 10b-5 does require a showing of materiality, which could (although \textit{Basic} makes no such suggestion) be read to require a demonstration of marketplace impact. That was Fischel's preferred route and something we will come to in Part IV. However, the more obvious route taking us from \textit{Basic} to the issue posed in \textit{Allegiance} comes via the Court's discussion of how the presumption of reliance can be rebutted.

As we have seen, \textit{Basic} says that a showing that the market was not fooled severs the causal link. That suggests that defendants can challenge certification based on the absence of market impact, although \textit{Basic} read literally would place the burden here on defendants to rebut, not plaintiffs to prove. In \textit{Allegiance}, however, the court read Fifth Circuit precedent to insist that plaintiffs prove market impact in order to gain class certification. It then bridged \textit{Basic} and \textit{Dura} by requiring as part of this market impact showing a demonstration of loss causation -- that the claimed losses were demonstrably attributable to the fraud. Echoing the \textit{Merck} case, it also connected market impact to \textit{Basic}'s requirement of a showing of market efficiency, saying that if it were determined for some reason that analysts

\textsuperscript{120} As Merritt Fox has pointed out, this approach -- though consistent with the desire not to provide "investor insurance" via Rule 10b-5 -- has a poor deterrence fit. It too easily absolves defendants for conduct that was harmful, to the economy as a whole and, at least at the time, to investors. See Fox, supra.

\textsuperscript{121} See Greenberg v. Crossroads Systems Inc., 364 F.3d 657 (5th Cir. 2004); Nathenson v. Zonagen Inc., 267 F.3d 400 (5th Cir. 2001). \textit{Allegiance} was written by Judge Patrick Higginbotham, who while a district judge wrote the seminal \textit{LTV} decision, cited and quoted by the Supreme Court in \textit{Basic}. See note --- supra.
and market makers did poorly at digesting the kind of information in question notwithstanding its apparent materiality, it would be evidence of inefficiency and hence grounds for denying certification for that reason alone.

Some preliminary responses are in order. First, as we have seen, Basic's rebuttal example was probably ill-chosen, or at least poorly explained, in terms of what was at issue in the case -- Rule 23(b)(3)'s insistence on the predominance of common issues. Reliance on a distorted price is common to all class members, which would seem to be enough to find class action treatment appropriate. The fact of distortion goes to the merits, not to either commonality or typicality. But Basic invites lower courts to think otherwise. Second, note the immense strategic importance of this shift. A detailed resolution of market impact/loss causation issues at the class certification stage substitutes fact-finding by the judge on an extraordinarily complex issue at an early stage of the proceeding for fact-finding by the jury at trial, and gives appellate courts far greater authority to review those findings.

Third, Allegiance's discussion of market efficiency illustrates the problems that arise when courts invoke efficiency without clear-cut guidance as to why. Citing Macey and Miller, it rightly notes that contemporary research shows that efficiency is not a yes-no question:122 some kinds of information are harder for market professionals (and hence the market itself) to digest. That doesn't mean that they are poor at digesting it, just that ambiguous information takes time to assess and can lead even experts to divergent views,123 i.e., slower speed of adjustment. But as discussed in Part II, this hardly proves that the market is so inefficient that it should bar class certification. Distortion is still quite possible. It is distortion -- not metrics of efficiency -- that is ultimately important. 124

Finally -- and strongly emphasized by Judge Dennis in dissent -- loss causation is entirely separate from reliance (transaction causation). There will be many situations where there is clear price distortion but difficult loss causation problems, so that insisting on proof of the latter as well as the former is unnecessary to the Basic inquiry. Nothing in Dura hints that loss causation is a class certification issue, rather than one of pleading and proof. In particular, the supervening cause problem
about which loss causation doctrine worries has no bearing whatsoever on the initial distortion question.

These are all good reasons to worry about a case like Allegiance as a doctrinal matter. But the more disturbing aspect of the decision comes when the court applies its version of doctrine to the facts, which dealt with alleged misstatements regarding the number of line installations the company had done during the first three quarters of 2001. Line installations were the basic measure of the company's growth in bringing on new customers. There was no general issue about market efficiency here: Allegiance was a Nasdaq company with more than 50 active market-makers and roughly 65% of its stock owned by large institutional investors. In early 2002, the company revised its 2001 line count downward by some 10% and disclosed other adverse news, both historic and forward-looking. The stock price fell almost 30%, and the company later went into bankruptcy.

In seeking class certification, plaintiffs did not produce an event study on either impact or corrective disclosure, though they said they could if necessary. They did, however, address loss causation by putting forward testimony and reports from key investment analysts covering Allegiance, who emphasized the line count revision in their notes right after the corrective disclosure. The company put forward other analyst reports downplaying the line count issue, but even the Fifth Circuit conceded that the plaintiffs had the better of this particular argument.

Yet the court of appeals decided that this testimony was not enough. It insisted on "expert" scientific proof that would disentangle the new bad news from the correction in the February disclosure: "[w]hen multiple negative items are announced contemporaneously, mere proximity between the announcement and the stock loss is insufficient to establish loss causation."125 Because plaintiffs' expert said this might be possible even though it had not yet been done, we cannot say how this might be shown. But there is reason to be skeptical: event studies simply do not produce clean results when there are two or more simultaneous issuer-specific events being measured over a short time horizon.

Here, then, is an example of the uncertainty problem encountered earlier. Event studies sometimes produce determinate results, sometimes not. When they do not, it is often not because there was no observable

125 487 F.3d at 271.
effect but because there were too many possible causes. This bundling problem is pervasive, leading commentators to note that under a strict loss causation regime the optimal strategy for a company is always to release corrective disclosure as part of a larger package, including more lies if necessary. What Allegiance does is takes this uncertainty problem and moves it up to the class certification stage, killing the case immediately.

Here, the methodological comparison with Basic is striking. Assuming the truth of plaintiffs' factual allegations, there seems to be a strong case of securities fraud. There is a very strong prima facie case of materiality (10% of a key performance indicator, bolstered with analyst testimony supporting the importance of the revision). There was also a palpable and large stock price drop tied to corrective disclosure. Though there simply is no compelling way to say how much of that drop was attributable to the alleged line count fraud, how much other bad news, it is hard to believe that the most likely answer is zero weight to the fraud. Dismissing the case on these grounds alone simply assures that the answer is zero. Obviously, this nearly irrebuttable presumption of no loss in the face of confounding events is a heavy thumb on the scale to favor the defense, and thus remarkably different from they way the Basic Court articulated its plaintiff-friendly presumption. The Fifth Circuit was hardly subtle about it either, explicitly referring to the interrorem nature of certified fraud-on-the-market class actions as a reason for scrupulous crafting of the rules.

It is tempting, then, to ascribe this simply to an increased hostility to private securities litigation since Basic was decided. That more lower courts (courts of appeals, especially) have become more critical of private securities litigation since 1988 can be taken as a given, and if the only point here is to use Allegiance to give an example of hostility, the point is hardly worth making. In fairness, however, there is probably more substance and coherence to what the court is doing in Allegiance. Recall Fischel and Easterbrook's "bargain." Their intuition was that the presumption of reliance was justified within the framework of a market test approach to reliance and causation, because a rigorous approach to marketplace distortion can readily distinguish good lawsuits from bad and thus reach more accurate results than subjective fact-finding. It turns

---

126 See, e.g., Spindler, supra.
127 See note ---- supra.
out that the methodological problems are often more difficult than they suggest, generating many ambiguous cases. Although from all indications Basic expected courts to deal with this ambiguity in the normal fashion – reserving the disputed factual issues for trial, by whatever evidence seems probative – Fischel and Easterbrook would likely disagree. Absent compelling, scientific evidence of marketplace distortion, they would argue, the potential for error and speculative abuse is simply too great. Empirical ambiguity should be resolved against the plaintiffs, early on in the case, rather than made a fact question for the jury so as nearly to guarantee a plaintiff-favorable settlement regardless of the persuasiveness of the claim.

And that is Allegiance in a nutshell. To use the Fifth Circuit’s own odd rhetoric, this approach “honors” the fraud-on-the-market theory. But it does so as a conservative idea meant to limit litigation as much as enable it. Instead of being faithful to Basic itself (though once again the Supreme Court’s confusion on the subject gives the revisionists ample cover), it is a deliberate effort to bring the fraud-on-the-market theory back to its fundamentalist roots, with efficiency and its metrics the source of all authority. When the Third Circuit said in Merck that it had "one of the 'clearest commitments' to the efficient market hypothesis," it sounds more like a profession of faith than the description of an analytical tool, and Allegiance follows the same orthodoxy. The conservative revisionism might explain Polymedica as well, to the extent that the First Circuit’s insistence on a strong empirical showing of efficiency is designed to reserve the fraud-on-the-market theory to those issuers where we have the most confidence in the power of the empirical tools.

If this is right, there is a profound methodological tension in the contemporary fraud-on-the-market case law, and it is mainly about how to deal with factual uncertainty, scientific reasoning versus ad hoc resolution. It is more than simple politics or business' influence over the judiciary. To explore this further, and complete our analysis of what has happened to Basic in the last twenty years, we now have to reconnect the

129 487 F.3d at 271.
130 432 F.3d at 269 (emphasis added). One might point out that in the social sciences, there is little that is worse than having a commitment to a hypothesis.
supposedly two separate issues that the Supreme Court addressed in Basic, materiality and reliance.

IV. RECONNECTING RELIANCE, MATERIALITY AND DUTY TO DISCLOSE

A. "Materiality as a Matter of Law"

The seemingly scientific method to approach fraud-on-the-market litigation is what Easterbrook and Fischel promoted and believed in and which cases like Allegiance have embraced. Questions of materiality, transaction causation (collective reliance) and loss causation are really one and the same, measurable through event studies of to gain a good sense of whether the alleged fraud really fooled the market and generated harm to contemporaneous traders. The background assumption is that if the market is efficient, it will be hard to fool, so that true cases of fraud will be relatively rare. Staying close to the scientific method thus checks unnecessary litigation.131

This brings us to the first half of Basic, its discussion of materiality, to consider the relationship between the two holdings. Recall that Basic rejected the effort by at least two circuits to hold preliminary merger negotiations "immaterial as a matter of law," i.e., grounds for dismissing a case prior to discovery or trial if that is all that the alleged misstatements or omissions addressed. Though Basic emphasizes that materiality is fact-intensive, so that materiality would seem rarely appropriate to decide as a matter of law, courts over the last twenty years have persisted in invoking that approach, including in a way that connects materiality to the presumption of reliance.

Suppose, then, that upon release of corrective disclosure, the market price does not go down. As we have just seen, this can be a loss causation defect that under Allegiance, at least, means that the lawsuit can be dismissed through denial of class certification. But according to some courts, this lack of market price reaction can also be the basis for holding the alleged misstatements immaterial as a matter of law. A trilogy of Third Circuit cases (two written by Judge Alito before his promotion) stand for the proposition that information is presumed immaterial as a matter of law when the stock price did not react

131 See pp. --- supra.
significantly to corrective disclosure.\footnote{In re Burlington Indus. Sec. Litig., 114 F.3d 1410 (3d Cir. 1997); Oran v. Stafford, 226 F.3d 275 (3d Cir. 2000); In re Merck & Co. Sec. Litig., 432 F.3d 261 (3d Cir. 2005). This line of cases was squarely rejected by the Ninth Circuit in No.84 Employee-Teamster Joint Council Pension Trust Fund v. America West Holding Co., 320 F.3d 920 (9th Cir. 2003), and is inconsistent with many other decisions. The approach that materiality cannot be determined by simple reference to a market test is probably the majority rule, not the Third Circuit's approach. See Greenhouse v. MCG Capital Corp., 392 F.3d 650, 660-61 (4th Cir. 2004). And even the Third Circuit may not be entirely consistent in its commitment to market efficiency. See Oran, supra, at 285 n.5 (claiming that a delayed market reaction was the more plausible explanation for a price drop); Padfield, supra, at 953 n. 165.} \textit{Merck} is simply the latest of these.

Because this is just \textit{Allegiance} in another guise (and does not in any event represent a clear majority view in the courts),\footnote{The Fifth Circuit has taken note of these holdings but expressed a preference for treating the issue in terms of reliance rather than materiality. See Nathenson v. Zonagen Inc., 267 F.3d 400, 415 (5th Cir. 2001).} we need not repeat the critique in any detail. Again, the court is invoking a questionable heuristic in a number of respects: the problem of information leakage, or professionals figuring out the problem before being told officially, or corrective disclosure bundled with positive news, all very plausible even in markets characterized by a high degree of efficiency. Event studies and similar analyses do not do well in assessing these other possibilities, so if the court is willing to look at nothing more than market reaction, plaintiffs probably lose what could be an otherwise strong case. Moreover, if we soften our assumptions about market efficiency, such conclusions become all the more doubtful, as our discussion of \textit{Merck} showed.

\textbf{B. The Indeterminacy Problem: Revisiting Basic Itself}

To this point, I have been fairly critical of excessive judicial insistence on market efficiency and event studies, insofar as courts have turned econometric analysis into a talisman without explaining why it should be determinative rather than just helpful. Fraud can operate powerfully in less-than-fully efficient markets and have pernicious effects that are hard to isolate even in those that are efficient. But our discussion of \textit{Allegiance} suggested that the obsession with efficiency and its metrics is really an effort to gain control over factual ambiguity that if
left to conventional rules of civil procedure promotes excessive litigation and settlement. So now I want to relax my criticism a bit by considering the implications of going in the opposite direction, embracing the plaintiff-friendly vision wherein we concede the limitations of economic science and resolve all significant factual uncertainty about materiality, market impact and loss causation in the common way, through fact-finder deliberation at trial, educated by whatever relevant evidence the parties have at hand.

In order to think this through, I want to come back to Basic itself. As noted earlier, the actual facts are not necessarily what they seem to those who only read the Supreme Court's opinion. So assume the following (over-simplified) version of the main denial of merger negotiations at issue in the case, which is based on how the trial judge saw the story. 134 Basic had been approached in 1976 by Combustion, which expressed an interest in acquiring it. Basic's management preferred to remain independent, but feared a hostile takeover by other chemical companies. Combustion, at least, indicated that it wanted a friendly deal and indicated it would leave Basic management in place with a good deal of autonomy. Seeing Combustion as a potential white knight if one should ever be needed but much preferring no deal at all, especially at the low price Combustion was suggesting, Basic didn't say no but nonetheless did nothing to invite or encourage serious merger negotiations.

In October 1978, a few months after last having heard any expression of interest from Combustion (and with no future discussions scheduled or planned), the price of Basic stock rose for a few days without obvious reason, and Basic was asked to comment on whether there were any “present or pending corporate developments” that could explain the rise. It said no. 135

---

134 The trial judge was considering defendants' motion for summary judgment, and had before him an extensive factual record developed in the course of discovery.
135 In fact, there had been a first denial a full year before, when there had been even fewer contacts between the two companies, and in the context of market movements clearly driven by false rumors that a different company, Flintkote, had an interest in Basic. There was a third denial as well, a short time after the second, in a report circulated to shareholders that did nothing more than repeat what had been said publicly in October 1978 denial. These two are less compelling cases for securities fraud than the one emphasized in the text -- the first because it came so early and was in the context of Flintkote's supposed interest, rather than anything to do with Combustion;
Was that securities fraud? There is, of course, the hindsight fact to add -- a couple of months after that denial Combustion came back with a serious offer far higher than any price previously mentioned, and this did lead to serious negotiations and Basic's consent to a friendly takeover. But as of October, was it an intentional, material misrepresentation? If Basic genuinely believed that the occasional (and theretofore unproductive) contacts at which Combustion expressed an interest were not the sort of thing that would constitute a material corporate development, much less explain the particular price move that had triggered the inquiry, then no. It wasn't trying to cover anything up, as commentators on Basic tend to assume. It's just that this wasn't serious or specific enough to be a "pending" corporate development, and to publicly say otherwise would probably have led to its own market gyrations based on the misimpression that Basic was now actually up for sale. Both the Sixth Circuit and the Supreme Court, however, insisted that this was at least a fact question for the jury, rejecting the trial judge's grant of summary judgment in Basic's favor. After one more frustrating round on remand at the Sixth Circuit, Basic (now a Combustion subsidiary) settled for a few million dollars, mostly in attorneys fees.

To me, Basic illustrates a problem with fraud-on-the-market cases that touches on many of the issues taken up in this paper. It is not that the case is extortionate or vexatious: there were certainly good faith, colorable grounds for plaintiffs to bring it. Rather, the problem combines "law-fact" indeterminacy with the risk of disproportion. My sense is that what was going on with Combustion probably was not material as of October, and that Basic probably acted in good faith in that it thought that it was responding fairly to the question about the recent stock price moves. That is certainly what the district judge thought. Others might disagree, of course. Even putting aside questions of how

136 See note --- supra. I am bothered by the possibility that Basic's management might have concealed these talks deliberately so as not to put the company in play for a hostile takeover, which they clearly feared. If that is the story, however, it is a good example of selfish concealment, which would not readily justify corporate (and opposed to individual) liability. See Langevoort, Perils, supra; Arlen & Carney, supra.

137 Levinson v. Basic Inc., 871 F.2d 562 (6th Cir. 1989).

138 Basic was settled for between $2 and $4.5 million, depending on how many seller claims were ultimately filed. Between $1.4 and $1.9 million of this amount was set aside for attorneys fees. See Langevoort, Perils, supra.
well a jury would do at assessing materiality or scienter in hindsight, however, the question is whether resolving this kind of issue by way of subjective fact-finding justifies potentially tens of millions of dollars (in today's money, at least) of legal fees and hundreds of millions in liability exposure.

There are really three points here that, cumulatively, underlie the intuition that this may not be a good investment of investor resources. The first was noted earlier: the suspicion that the measure of damages in securities fraud action is systematically excessive, which can lead to unnecessarily large judgments or settlements. This was first raised by Easterbrook and Fischel, who probably set the problem aside too easily. The excess is compounded by the insurance-like nature of the system: putting aside the less common situation of third-party (e.g., investment bank) liability, shareholders themselves fund settlements and judgments, directly or indirectly. The high attorneys fees are a form of tax to facilitate a redistributive system.

That by itself is not necessarily damning if the promotion of stock price accuracy and the compensation of investors is important enough and if fraud-on-the-market lawsuits serve these goals efficiently. Moreover, there is the reliance interest on stock price integrity that Basic so stresses, which suggests that investors who buy or sell at distorted prices have a right to compensation. The second point, however, is that it is easy to misunderstand the place of stock price accuracy and the idea of a "right" to recovery. Securities regulation tries to make stock prices accurate, but the effort is necessarily incomplete. In fact, securities regulation tolerates a substantial amount of nondisclosure of material...

---

139 See Mitu Gulati et al., Fraud by Hindsight, 98 Nw. U. L. Rev. 773 (2004). The well-researched psychological phenomenon is that people do poorly at assessing the likelihood that an event would come to pass as of some earlier date once told that in fact it did come to pass. They substantially overstate the risk compared to those not told what ultimately happened.

140 See notes --- supra.

141 The best explanation of this is Edmund Kitch, The Theory and Practice of Securities Disclosure, 61 Brook. L. Rev. 763 (1995). Disclosure is costly in terms of production, delivery and its effects on legitimate corporate needs for confidentiality, and these counter the desire for "full disclosure." The result is a compromise. See also Troy Paredes, Blinded by the Light: Information Overload and its Consequences for Securities Regulation, 81 Wash. U.L.Q. 417 (2003). For an argument that stock price accuracy should be abandoned as a disclosure philosophy in favor of policing against managerial disloyalty, see Paul Mahoney, Mandatory Disclosure as a Solution to Agency Problems, 62 U. Chi. L. Rev. 1047 (1995).
information, for sound policy reasons, so that even efficient markets (in the semi-strong sense) are often inaccurate. As a result, the default rule is no duty to disclose even material information in the absence of a specific SEC or judicially-created duty. *Basic* is a good example: as the Court conceded, the company had no obligation to divulge any talks with Combustion, just the duty not to lie.\(^{142}\) But for the happenstance of an inquiry from the stock exchange (or in the case of the first disclosure, false rumors about a different company's potential interest in Basic) investors would have been in largely the same position than Basic supposedly put them through its denials, with no serious risk of liability at all. Surprise announcements are commonplace and usually perfectly lawful, even though company managers knew of the surprise well beforehand but stayed silent. Investors necessarily assume the risk of occasional differences between what is known publicly and privately, without any expectation of compensation through litigation. This brings us back to a point made earlier -- no reasonable investor could possibly assume that stock prices are not distorted, whether by fraud or otherwise, without appreciating the inevitable risk involved in so doing.

Were the law clear about both materiality and duty to disclose, this still would not be all that troubling: the law would simply mark the line between legitimate and illegitimate nondisclosure. That brings us to the third point. *Basic* determined that materiality as a factual matter requires going through a horribly indeterminate exercise. And as I have written about extensively elsewhere, the duty to disclose is as much of a muddle, if not more.\(^{143}\) It takes little stretching of the half-truth doctrine to find something that was said that somehow relates to something important that was not, and challenge the company's silence as raising question for the fact-finder about whether the market was misled. That goes back to the earlier question posed about the facts of *Basic*. I doubt that there was fraud, but others might differ. The problem is that there is no discernable baseline from which to judge whether Basic was in bounds or not. It is all open to argument, and in the glare of hindsight.

In turn, this is where concerns about expense and disproportionality arise. If the most that can be said is that there *might* be materiality and a breach of duty -- i.e., that reasonable people could

\(^{142}\) 485 U.S. at 240 n.17.

think there was no liability -- it is far from clear that investors need protection that costs millions for each lawsuit rather than adding this to the risk of mispricing they commonly assume and can diversify away reasonably well. A fortiori if we suspect a systematic risk of hindsight bias. And a liability threat of millions of dollars, if not (in today’s environment) billions, seems awfully big for conduct that reasonable people may see as fairly innocent. Put simply, there is little threat to investors if cases like Basic, where there are bona fide doubts about whether there is any fraud, are dismissed before trial. Remember, the presumption of reliance is an act of juristic grace, in the name of both fairness and efficiency. We need not follow it slavishly if there are doubts about either, much less both.

I now may seem to have changed direction completely in this paper, joining the hostile judges I was so critical of in Parts II and III. How can I reconcile my criticism of cases like Polymedica and Allegiance with what I have just said? As I understand it, something like this was Jack Coffee's reason why the defendants should win in Dura:

144 even though the no-liability decision might rest on a weak conceptual footing, it has the virtue of taking doubtful cases off the table promptly. If so, I am sympathetic but ultimately disagree.

My concern about these cases is that they make ham-fisted doctrinal or procedural moves that too easily affect the best of lawsuits along with the doubtful ones. Taking Allegiance seriously, one could imagine a truly dastardly fraud where class certification is denied simply because the company announced additional bad news along with its acknowledgement of wrongdoing. All deterrence effect is lost.

Let's return once more to Basic. The Court rejected the "agreement in principle" test for the materiality of merger negotiations in favor of the more generic probability-magnitude standard, fearing it would open up too much opportunity to lie (or engage in insider trading, which the SEC was worried about). I wouldn't have accepted agreement in principle either, because it departs far too much from defining what is significant. But probability-magnitude is too hard to apply, especially in hindsight, and thus invites too much marginal fraud-on-the-market litigation. My sense is that a better case could have been made for saying that merger negotiations need not be treated as material for corporate disclosure purposes until they have reached a point at which

144 See Coffee, supra.
the parties are actively and seriously seeking a deal so that one is reasonably likely to occur. Preliminary merger negotiations, however, are but a small piece of materiality, and my concern about the ability of borderline cases to claim a disproportionate share of public and investor resources is a more general one. And I doubt that one could ever address all the hard materiality questions on an item-by-item basis.

The only way to respond, then, is through some kind of procedural innovation, and any approach that creates a higher standard for materiality or duty cannot wait for it to be applied at trial. There has to be an early-stage determination, either prior to discovery or with carefully restricted discovery. For this reason, I am not that averse to the idea of addressing materiality as a matter of law.

That leads me to a suggestion for compromise. I have come to accept the PSLRA's heightened pleading standard on scienter (though I am still uncomfortable with the near impenetrable discovery bar) because it generates a reasonable balance: if there is not enough circumstantial or direct evidence to support a cogent inference of scienter in the way Justice Ginsburg described it in *Tellabs*, the expenses and risks that investors ultimately bear probably do weigh against going forward. I would thus be willing to extend this to materiality and duty as well: unless the inferences point strongly enough in favor of both materiality and a duty to speak, then the same result. That shifts power to judges and away from juries in ways that will not always be comfortable, but for the reasons described above, is better than going through discovery and a trial that is itself largely a roll of the dice.

Once a case survives this early-stage merits test, however -- and many will -- there is no need for the overly harsh second round of pre-discovery defenses on matters such as market impact or loss causation that are mainly remedial, as in *Allegiance*. Nor for obsession in class certification with distractions such as measures of market efficiency, as

---

146 See note --- supra.

147 I am not suggesting that this is consistent with the Federal Rules of Civil Procedure or the PSLRA and thus am thinking in terms of possible legislative reform. And to be clear, I would not take the approach that requires compelling econometric evidence of materiality as in *Merck*, however, although a lack of price impact should certainly be an important factor in the analysis.
in *Polymedica*. If there is a strong inference of fraud (not just scienter), the work of class certification could revert simply to what Rule 23(b)(3) instructs, an examination of whether common issues predominate, without awkward or disingenuous efforts to turn class certification into a merits inquiry. And while loss causation necessarily remains plaintiffs' burden under the PSLRA, the inevitable doubts should be resolved against the wrongdoer so long as there is a solid basis for believing that some portion of the loss was actually attributable to the fraud. This approach -- tough on the merits at an early stage of the lawsuit, but more forgiving once there is a strong inference of fraud -- balances the competing interests of deterrence, compensation and cost-minimization. Without better balance up front, however, courts are likely to continue to be excessively harsh on these ancillary questions.

V. CONCLUSION

*Basic* has left us an odd legacy after twenty years. Without explaining adequately how or why, it made market efficiency seem essential for fraud-on-the-market litigation, which invited courts to use the tools of financial economics as if they could readily produce clear-cut solutions to messy, complex fraud cases. That was an illusion. Doctrinally, the explanations in cases like *Polymedica* and *Allegiance* -- even *Dura* -- do not make a great deal of sense.

In the mid-1980's, when *Basic* was decided, market efficiency claims (and market stories generally) were appealing and persuasive across a fairly wide spectrum of intellectual opinion. There was a cache to invoking sophisticated theory, separate from actually understanding the internal mechanics of the marketplace. That, of course, was Justice White's point. Over time, however, as financial economics has become less convinced that market efficiency works quite so cleanly or powerfully, cache has given way to simple expressions of faith. I

---

148 The classic article on how market efficiency is generated is often cited (including in *Basic*) as a testament to efficiency; in fact, it warned that efficiency was a highly complex phenomenon and unlikely to be accurate under all conditions all of the time. Ronald Gilson & Reinier Kraakman, *The Mechanisms of Market Efficiency*, 70 Va. L. Rev. 549 (1984). That it was read as a testament says much about the intellectual environment of the times. See Donald C. Langevoort, *Foreword: Revisiting Gilson and Kraakman's Efficiency Story*, 28 J. Corp. L. 499, 501 (2003); for more on the ideological point, see Langevoort, *Theories*, supra, at 912-20.
suspect that the courts' promotion of market efficiency beyond what *Basic* likely intended is partly due to the sense that for many judges, invoking a free-markets sounding idea is a way to impose order on what otherwise becomes a very messy set of questions with too many “maybes” as answers.

The deeper story, though, is one I have tried to emphasize throughout this paper. By trying heroically (but unsuccessfully) to fashion a cause of action around a presumption of reliance, *Basic* makes it too easy to think of recovery as a right rather than thinking of compensation as a matter of grace that is granted even though it is not particularly reasonable for investors simply to put their faith in stock price integrity. There are good reasons for fraud-on-the-market lawsuits, in terms of both compensation and -- especially -- deterrence, but also good reasons to worry about indeterminacy and disproportion. Reliance and loss causation have never has been the right subjects for dealing with this, and one can imagine a world in which neither is a significant element of the cause of action.\(^{149}\) Unfortunately, for whatever reasons, they have instead become the biggest battleground, thereby becoming a distraction from what really is important.
